RE: Approval of Minor Modification – Closure Plan Phase I Landfill
Big Rivers Electric Corp - DB Wilson Station Landfill
Agency Interest No. 3319
Solid Waste Permit No. SW09200004
Application I.D. No. APE20200002
Ohio County

Dear Mr. Cole,

The Kentucky Division of Waste Management (DWM), Solid Waste Branch completed review of the application referenced above, received on August 6, 2021, and additional information received on August 17, 2021. The application proposing to modify the closure and post-closure plan for the Phase I landfill is hereby approved.

Please find enclosed a revised permit. To receive an electronic copy of the approved application, please utilize the Kentucky Department of Environmental Protection's eSearch tool via https://dep.gateway.ky.gov/eSearch/Search_Issued_Approvals.aspx on or around November 10, 2021.

Be advised that if you consider yourself aggrieved by the issuance of this permit, you have the right, pursuant to KRS 224.10-420(2) to file a petition demanding a hearing with the Cabinet. This right shall be limited to a period of thirty (30) days. The petition should be filed with The Office of Administrative Hearings located at 211 Sower Blvd., Frankfort, KY 40601. See https://eec.ky.gov/About/Administrative-Hearings/Pages/default.aspx for additional information.

If you need any additional information, please contact Ken Melton, P.E. at (502) 782-6415 or via ken.melton@ky.gov.

Sincerely,

Danny Anderson

Danny Anderson, P.E.
Manager, Solid Waste Branch

Kentucky Energy and Environment Cabinet
Department for Environmental Protection
Division of Waste Management

PERMIT

Facility: **Big Rivers Electric Corp - DB Wilson Station Landfill**
5663 KY 85 W
Centertown, KY 42348

Permittee: **Big Rivers Electric Corporation**
5663 KY 85 W
Centertown, KY 42328

Agency Interest: **Big Rivers Electric Corp - Wilson Station**
5663 KY 85 W
Centertown, KY 42348

The Division has issued the permit under the provisions of KRS Chapter 224 and regulations promulgated pursuant thereto. This permitted activity or activities are subject to all conditions and operating limitations contained herein. Issuance of this permit does not relieve the permittee from the responsibility of obtaining any other permits, licenses or approvals required by this Division or other state and local agencies.

No deviation from the plans and specifications submitted with your application or any condition specified herein is allowed, unless authorized in writing from the Division. Violation of the terms and conditions specified herein may render this permit null and void. All rights of inspection by representatives of the Division are reserved. Conformance with all applicable Waste Management Regulations is the responsibility of the permittee.

Agency Interest ID #: **3319**

Solid Waste Permit #: **SW09200004**

County: **Ohio**

Permitted Activities:

Subject Item	Activity	Type	Status
ACTV005	Special Waste Landfill-Coal/09200004	Construction/Operation	Active
ACTV009	CCR Unit - Landfill/09200004	Construction/Operation	Active

PERMIT

Acreage Summary:

Waste Disposal Area (in Acres):

Activity	Disposal Area
CCR Unit - Landfill	91.83
Special Waste Landfill-Coal	82.47
Total Disposal Area	174.30
Total Permitted Area	700.00

Cost Estimate Summary:

Coverage Type	Cost Estimate	Effective	Comments
Closure	$31,217,562.00	10/28/2021	Approved under APE20200002
Post-Closure	$9,312,695.00	10/28/2021	Approved under APE20200002

Financial Assurance Summary:

The owner or operator shall maintain the following financial assurance approved by the Division in compliance with KRS Chapter 224.40-650, KRS Chapter 224.50-862, 401 KAR 45:080, and 401 KAR 48:310:

Instrument Type	Instrument Number	Amount	Date Received	Comments
Letter of Credit	KY062-H-5102-002	$2,504,400.00	07/15/2009	See Page 3 for Additional Information

First Operational Permit Effective Date: 11/27/1984 -- Inert Landfill

Permit Effective Date: 07/01/1992

Permit Expiration Date: Life of Facility

Permit issued: 10/28/2021

Sincerely,

Danny Anderson, P.E.
Manager, Solid Waste Branch

PERMIT

Permit Conditions:

Facility Information and/or Conditions

1. An updated cost estimate incorporating the technical standards of 401 KAR Chapter 46 was submitted to the Solid Waste Branch (SWB) on June 3, 2021 as part of a proposed modified closure plan, referenced as APE20200002. The proposed estimates to be accepted are comprised of Phase I closure ($16,044,468.00) and post-closure ($1,314,500.00), & Phase II closure ($15,478,914.00) and post-closure ($7,998,195.00). The owner or operator shall submit the increase in financial assurance, in accordance with 401 KAR 45:080 and the updated estimate, no later than November 8, 2021.

Subject Items

ACTV0005 - Special Waste Landfill-Coal

Standard Requirements:

1. General: The owner or operator of a special waste facility shall comply with KRS Chapter 224 and 401 KAR Chapters 30, 40 and 45 for the construction and operation of special waste facilities. [KRS 224.50-760]

2. General: For construction and operation of the special waste landfill, the owner or operator shall comply with KRS Chapter 224.50-760, 401 KAR 45:030, 45:110 and the approved permit application(s). [401 KAR 45:110]

Variances, Alternate Specifications and Special Conditions:

1. Financial Assurance: The maximum extent of operation includes the area of the landfill identified by an operating permit and for which the final cover Construction Progress Report has not yet been approved by the Cabinet. The current maximum extent of operation for this Special Waste Landfill is 91.8 acres. [401 KAR 45:080]

2. General: The Special Waste Landfill previously operated as a single permitted activity recorded as ACTV0005. On August 4, 2021, the permit issued reflected the updates in accordance with the 401 KAR Chapter 46 technical standards. The Special Waste Landfill permitted activity was split into two separate permitted activities: the Phase I Special Waste Landfill and the Phase II CCR Landfill. The Phase I Special Waste Landfill footprint consists of approximately 94.29 acres, which includes disposal area and portions of extended cover and run-off ditches. The Phase I Special Waste Landfill continues to be recorded as a Special Waste Landfill (ACTV005). The Phase II CCR Landfill was split from and converted from a Special Waste Landfill (ACTV005) to a CCR Unit - Landfill (ACTV009) on August 4, 2021. [401 KAR 45:140 Section 2]

3. Wastestreams: The permittee may accept special waste streams as described in the approved plans and applications from the D. B. Wilson Station, Ohio Co., Island, Kentucky. If waste is accepted in the Phase I Special Waste Landfill, the owner or operator shall notify the Solid Waste Branch in writing within forty-eight (48) hours. [401 KAR 45:110 Section 3(7), 401 KAR 45:140 Section 2]

4. Closure: Upon cessation of special waste disposal activities at the landfill, the owner or operator shall implement the approved closure plan in accordance with its terms and the requirements of this chapter. An owner or operator may be required to revise a closure plan prior to implementation. [401 KAR 45:110 Section 5]

5. Wastestreams: The permittee may accept fly ash and bottom ash from the Kenneth Coleman Station, Hancock

Co., Hawesville, KY. If waste is accepted in the Phase I Special Waste Landfill, the owner or operator shall notify the Solid Waste Branch in writing within forty-eight (48) hours. [401 KAR 45:110 Section 3(7), 401 KAR 45:140 Section 2]

6. Closure: Closure: A special waste landfill shall be closed in a manner that complies with 401 KAR 30:031. The owner or operator of a special waste landfill shall submit a closure plan that includes a closure design as specified in subsection (2) of 401 KAR 45:110, Section 5, a closure cost estimate in accordance with Section 2 of 401 KAR 45:080, a narrative discussing the closure plan's conformance with 401 KAR 30:031, and a schedule for implementation of the plan. Deviations from any approved closure plan shall receive prior approval via an approved permit modification. A closure Construction Progress Report shall be submitted upon completion of closure activities within thirty (30) days. [401 KAR 45:110 Section 5]

7. General: The owner or operator may only accept waste at the special waste landfill from the sources which are approved per 401 KAR 45:020, Section 2(1)(a), 45:030, Section 8(1)(a), and 45:110. If waste is accepted in the Phase I Special Waste Landfill, the owner or operator shall notify the Solid Waste Branch in writing within forty-eight (48) hours. [401 KAR 45:110, 401 KAR 45:140 Section 2]

County Sources - The owner or operator may accept waste as authorized by the Cabinet pursuant to KRS 224 and/or 401 KAR Chapter 47 from the following counties:

Kentucky: Hancock, Ohio

Approved Applications - The owner or operator shall comply with applicable statutes and regulations and the following approved applications:

1. 10-01-1979 - As-Built Plans Approved
2. 04-16-1981 - As-Built Plans Approved
3. 09-06-1984 - First Construction Permit Issued
4. 10-10-1984 - As-Built Plans Approved
5. 11-27-1984 - First Operation Permit Issued (Inert Landfill) - Effective on 11-27-1984
6. 12-07-1987 - As-Built Plans Approved
7. 10-28-1988 - As-Built Plans Approved
8. 09-12-1990 - Permit Renewal - APE19890001
9. 03-10-1994 - Major Modification - LI1MOVX1 - Vertical Expansion Approval & Continuation to Operate - APE19920001
10. 01-30-1996 - Groundwater Monitoring Plan - APE19900001
11. 02-28-1996 - Minor Modification #1 - LI1MOMN1 - APE19900002
12. 02-28-1996 - Permit Renewal #2 - LI1PR2 - APE19930001
13. 03-22-1999 - Permit Transfer - LS1PT1 - Transfer Big Rivers Electric Corp to Western Kentucky Energy Corp - APE19980001
14. 11-17-2004 - Add Waste Source - LS1MOAD1 - Fly Ash and Bottom Ash from Kenneth Coleman Plant – APE20010001
15. 12-20-2004 - Special Waste Beneficial Reuse - Poz-O-Tec - ARP20040001
16. 02-25-2008 - Groundwater Assessment Report - AIN20050002
17. 03-14-2005 - Minor Modification - Vertical Expansion - APE20040001
18. 05-05-2005 - Groundwater Assessment Plan - AIN20040001
19. 02-26-2009 - Groundwater Monitoring Plan - APE20080002
20. 10-08-2009 - Monitoring Well CPR & Authorization for Waste Placement in Bond Increment Area 2 – APE20090004

21. 05-19-2010 - Permit Transfer - From Western Kentucky Energy to Big Rivers Electric Corporation – APE20090002
22. 11-30-2017 - Amendment to Groundwater Monitoring Plan - APE20170001
23. 08-04-2021 - See the CCR Unit-Landfill activity (ACTV0009) for additional information
24. 08-04-2021 - Groundwater Assessment Plan - AIN20140001
25. 10-28-2021 - Modification, Phase I Closure and Post-Closure - APE20200002

ACTV0009 - CCR Unit - Landfill

Variances, Alternate Specifications and Special Conditions:

1. General: The Special Waste Landfill previously operated as a single permitted activity recorded as ACTV0005. On August 4, 2021, the permit issued reflected the updates in accordance with the 401 KAR Chapter 46 technical standards. The Special Waste Landfill permitted activity was split into two separate permitted activities: the Phase I Special Waste Landfill and the Phase II CCR Landfill. The Phase II CCR Landfill consists of approximately 91.83 acres. The Phase II CCR Landfill was split from and converted from a Special Waste Landfill (ACTV005) to a CCR Unit - Landfill (ACTV009) on August 4, 2021. Additional information pertaining to this conversion can be found in permitting actions AIN20140001 and APE20200002. The Phase II CCR Landfill is a CCR Unit as defined by 401 KAR 46:101 and is subject to the standards pursuant to 401 KAR 46:110, and the Phase II CCR Landfill remains subject to the procedural requirements in 401 KAR Chapter 45. [401 KAR 45:020, 401 KAR 45:025, 401 KAR 45:030, 401 KAR 45:040, 401 KAR 45:050, 401 KAR 45:080, 401 KAR 45:140, 401 KAR 46:110]

2. General: The owner or operator of a Coal Combustion Residuals (CCR) Unit shall comply with KRS Chapter 224 and 401 KAR Chapter 46 for the construction, operation, maintenance, and closure of a CCR Unit and other provisions pursuant to 401 KAR Chapters 30, 40, and 45 as applicable. The owner or operator shall comply with the applicable provisions in the Approved Applications listed on this permit document for ACTV0005 - Special Waste Landfill-Coal and with all provisions in the Approved Applications listed on this permit document for ACTV0009 - CCR Unit - Landfill. [401 KAR 45:030, 401 KAR 45:140]

3. General: The owner or operator shall submit the $15,000 annual fee no later than July 31 of each year pursuant to 401 KAR 46:120. Applications and reports specific to only the Phase II CCR Landfill, or only other CCR Units, for this facility shall not be subject to the filing fees pursuant to 401 KAR 45:250. [401 KAR 46:120 Section 4]

Approved Applications - The owner or operator shall comply with applicable statutes and regulations and the following approved applications:

1. 08-04-2021 - See the Special Waste Landfill-Coal activity (ACTV0005) for additional information and site history
2. 08-04-2021 - Permit Issued in accordance with 401 KAR Chapter 46 technical standards - AIN20140001

Financial Assurance

ACTV0001 - Financial Assurance

The following is a history of the financial assurance for this facility:

1. 10-07-1984 - SB #B5703-16, $879,600.00
2. 07-14-1994 - SB #CSB0162808, $879,600.00
3. 07-14-1994 - SB #B5703-16 released
4. 07-08-1998 - LOC #SLCDC3896/912678, $879,600.00 rejected
5. 11-16-1998 - LOC #SLCDC3896/912767, $879,600.00 rejected
6. 01-15-1999 - LOC #SLCDC3896/912851, $879,600.00
7. 01-15-1999 - SB #CSB0162808 released
8. 02-26-2004 - LOC #033250100, $951,263.00
9. 02-26-2004 - LOC #SLCDC3896/912851 released
10. 08-19-2004 - LOC #033250100 increased to $966,483.00
11. 06-30-2004 - LOC #033250100 increased to $986,779.00
12. 05-10-2006 - LOC #033250100 increased to $1,008,779.00
13. 07-24-2007 - LOC #033250100 increased to $1,039,735.00
14. 07-15-2009 - LOC #KY06-2-H-5102-002, $2,504,400.00
15. 07-31-2009 - LOC #033250100 released.

Monitoring Conditions

GSTR0001 - Groundwater Monitoring - SWB: (Phase I monitoring wells)

Group Members: STRC0001 - Well MW-1; STRC0002 - Well MW-2; STRC0003 - Well MW-3; STRC0004 - Well MW-4

Standard Requirements:

1. The owner or operator shall satisfy the requirements of 401 KAR 45:160 for all wastes and waste constituents contained in the site or facility. [401 KAR 45:160 Section 1]

2. The permittee shall monitor for other parameters as required by the Cabinet. [401 KAR 45:160 Section 8(2)(c)]

3. The owner or operator shall monitor groundwater on the approved schedule at each approved groundwater monitoring location in accordance with 401 KAR 45:160, the permit, and the approved plans. A table summarizing the parameters to be monitored, their respective limits and monitoring frequency is included herein. [401 KAR 45:160, 401 KAR 45:140 Section 1(1)]

4. The owner or operator shall conduct statistical analysis of the groundwater data in accordance with 401 KAR 45:160 Section 6 and the approved applications. The statistical test chosen shall be conducted separately for each parameter in each well for each monitoring event. The results shall be maintained as part of the facility record throughout the operating and post-closure life of the facility. [401 KAR 45:160 Section 6, 401 KAR 45:140 Section 1(1)]

5. The groundwater analytical data and statistical analysis shall be submitted on forms provided by the Cabinet,

within sixty (60) days after sampling or 15 days of the completion of statistical analysis, whichever is sooner. [401 KAR 45:160 Section 4]

6. If the analysis of groundwater sample results indicates contamination (i.e., a statistical or MCL exceedence) as specified in 401 KAR 45:160 Section 5, the owner or operator shall notify the Cabinet within (forty-eight) 48 hours of receiving the results and shall arrange to split samples no later than ten (10) days from the receipt of the results. [401 KAR 45:160 Section 5]

7. The owner or operator shall be required to prepare and submit a groundwater contamination assessment plan if laboratory analyses of one (1) or more public or private water supplies or monitoring wells at the site shows the presence of one (1) or more parameters above the maximum contaminant level (MCL) as specified in 401 KAR 30:031 or a statistically significant increase over background levels for parameters that have no MCL. [401 KAR 45:160 Section 5]

8. The owner or operator shall provide alternate water supplies to all affected parties within twenty-four (24) hours of notification of the Cabinet that sample results indicate contamination of a drinking water supply if it has been determined that the special waste site or facility is the probable source of the contamination. [401 KAR 45:160 Section 3]

9. If required by the Cabinet, groundwater contamination assessment and corrective action shall be performed in full compliance with all provisions of 401 KAR 45:160 Section 5. [401 KAR 45:160 Section 5]

Variances, Alternate Specifications and Special Conditions:

1. Monitoring Well Purging: Monitoring wells shall be purged using low-flow sampling equipment, at flow rates between 100 and 500 milliliters per minute. Drawdown during purging shall not exceed 0.5 feet. Purge water shall be passed through a calibrated flow cell until three consecutive readings taken at three- to five-minute intervals show that: a) pH varies no more than plus or minus 0.1 Standard Units; b) conductivity varies no more than plus or minus 3%; c) temperature varies no more than plus or minus three percent; d) dissolved oxygen varies no more than plus or minus 10%, or is less than 0.5 mg/L; e) redox potential varies no more than plus or minus 10 mV; and f) turbidity varies no more than plus or minus 10%, or is less than 5 NTU. [401 KAR 45:140 Section 1, 401 KAR 45:140 Section 2]

2. Monitoring Well Purging: If, after one hour of purging, three consecutive readings taken at three- to five-minute intervals show that: a) pH varies no more than plus or minus 0.1 Standard Units; and b) conductivity varies no more than plus or minus 3%, purging may be considered complete. [401 KAR 45:140 Section 1, 401 KAR 45:140 Section 2]

3. Monitoring Well Purging: If parameters have not stabilized after five well volumes have been purged from the well casing, purging may be considered complete. [401 KAR 45:140 Section 1, 401 KAR 45:140 Section 2]

4. The permittee shall submit a potentiometric map in each semiannual report showing: 1) the locations of all monitored wells and piezometers; 2) waste disposal areas; 3) groundwater elevation in each well and piezometer in feet above mean sea level referenced to a USGS datum; and 4) potentiometric contours in feet above mean sea level referenced to a USGS datum. [401 KAR 45:140 Section 2]

5. Groundwater Assessment: The owner or operator shall submit a Groundwater Assessment Report which shall:

a) Be submitted no later than December 15, 2022;
b) Define the existence, quality, quantity, areal extent, and depth of groundwater degradation from the facility and the rate and direction of migration of contaminants in groundwater. Contaminant concentrations and groundwater flow rates and directions shall be determined empirically, in a manner sufficient to ascertain current or potential impacts of groundwater pollution from the facility upon both human and ecological receptors;
c) Empirically determine and include the point(s) and mechanism(s) of discharge of polluted groundwater from the site into surface water pursuant to 401 KAR 45:160, Section 5(4);
d) Include all new data collected, an analysis of both new and preexisting data used or obtained in the assessment investigation, and recommendations on the necessity for the abatement of groundwater pollution. Recommendations on the necessity for the abatement of groundwater pollution shall be empirically based and include an evaluation of potential impacts to both human and ecological receptors pursuant to 401 KAR 45:160 Section 5(7); and
e) Evaluate whether groundwater pollution at the facility violates (or has the potential to violate) any provision of the environmental performance standards of 401 KAR 30:031. [401 KAR 45:140 Section 2, 401 KAR 45:160]

6. Groundwater monitoring wells shall be constructed and maintained in accordance with 401 KAR 45:160 Section 3, 401 KAR 6:350, the permit, and the approved plans. [401 KAR 45:140 Section 1(1), 401 KAR 45:160 Section 3, 401 KAR 6:350]

7. No monitoring well construction, maintenance, or abandonment may be conducted without prior approval by the Division of Waste Management. [401 KAR 45:140 Section 1(1), 401 KAR 6:350 Section 12(1)]

8. Groundwater Well Construction: The owner or operator shall comply with the standards and provisions in 401 KAR Chapter 6. This includes, but not limited to, the provision each monitoring well shall be constructed, modified, or abandoned by a monitoring well driller or monitoring well driller assistant certified in accordance with KRS 223.425 and 401 KAR 6:320. [401 KAR 6:350]

9. Groundwater Well Construction: The Division of Waste Management shall be notified at least ten (10) working days prior to monitoring well construction, modification, or abandonment so that a Cabinet representative may be present at the construction, modification, or abandonment. [401 KAR 6:350 Section 12]

GSTR0002 - Groundwater Monitoring - SWB: (Phase II monitoring wells)

Group Members: STRC0031 - Well MW-5; STRC0032 - Well MW-6; STRC0033 - Well MW-8; STRC0034 - Well MW-7; STRC0036 - Well MW-10

Standard Requirements:

1. The owner or operator shall satisfy the requirements of 401 KAR 45:160 for all wastes and waste constituents contained in the site or facility. [401 KAR 45:160 Section 1]

2. The permittee shall monitor for other parameters as required by the Cabinet. [401 KAR 45:160 Section 8(2)(c)]

3. The owner or operator shall monitor groundwater on the approved schedule at each approved groundwater monitoring location in accordance with 401 KAR 45:160, the permit, and the approved plans. A table summarizing the parameters to be monitored, their respective limits and monitoring frequency is included herein.

[401 KAR 45:160, 401 KAR 45:140 Section 1(1)]

4. The owner or operator shall conduct statistical analysis of the groundwater data in accordance with 401 KAR 45:160 Section 6 and the approved applications. The statistical test chosen shall be conducted separately for each parameter in each well for each monitoring event. The results shall be maintained as part of the facility record throughout the operating and post-closure life of the facility. [401 KAR 45:160 Section 6, 401 KAR 45:140 Section 1(1)]

5. The groundwater analytical data and statistical analysis shall be submitted on forms provided by the Cabinet, within sixty (60) days after sampling or 15 days of the completion of statistical analysis, whichever is sooner. [401 KAR 45:160 Section 4]

6. If the analysis of groundwater sample results indicates contamination (i.e., a statistical or MCL exceedence) as specified in 401 KAR 45:160 Section 5, the owner or operator shall notify the Cabinet within (forty-eight) 48 hours of receiving the results and shall arrange to split samples no later than ten (10) days from the receipt of the results. [401 KAR 45:160 Section 5]

7. The owner or operator shall provide alternate water supplies to all affected parties within twenty-four (24) hours of notification of the Cabinet that sample results indicate contamination of a drinking water supply if it has been determined that the special waste site or facility is the probable source of the contamination. [401 KAR 45:160 Section 3]

Variances, Alternate Specifications and Special Conditions:

1. Monitoring Well Purging: Monitoring wells shall be purged using low-flow sampling equipment, at flow rates between 100 and 500 milliliters per minute. Drawdown during purging shall not exceed 0.5 feet. Purge water shall be passed through a calibrated flow cell until three consecutive readings taken at three- to five-minute intervals show that: a) pH varies no more than plus or minus 0.1 Standard Units; b) conductivity varies no more than plus or minus 3%; c) temperature varies no more than plus or minus three percent; d) dissolved oxygen varies no more than plus or minus 10%, or is less than 0.5 mg/L; e) redox potential varies no more than plus or minus 10 mV; and f) turbidity varies no more than plus or minus 10%, or is less than 5 NTU. [401 KAR 45:140 Section 1, 401 KAR 45:140 Section 2]

2. Monitoring Well Purging: If, after one hour of purging, three consecutive readings taken at three- to five-minute intervals show that: a) pH varies no more than plus or minus 0.1 Standard Units; and b) conductivity varies no more than plus or minus 3%, purging may be considered complete. [401 KAR 45:140 Section 1, 401 KAR 45:140 Section 2]

3. Monitoring Well Purging: If parameters have not stabilized after five well volumes have been purged from the well casing, purging may be considered complete. [401 KAR 45:140 Section 1, 401 KAR 45:140 Section 2]

4. The permittee shall submit a potentiometric map in each semiannual report showing: 1) the locations of all monitored wells and piezometers; 2) waste disposal areas; 3) groundwater elevation in each well and piezometer in feet above mean sea level referenced to a USGS datum; and 4) potentiometric contours in feet above mean sea level referenced to a USGS datum. [401 KAR 45:140 Section 2]

5. Groundwater monitoring wells shall be constructed and maintained in accordance with 401 KAR 45:160 Section 3, 401 KAR 6:350, the permit, and the approved plans. [401 KAR 45:140 Section 1(1), 401 KAR 45:160

Section 3, 401 KAR 6:350]

6. No monitoring well construction, maintenance, or abandonment may be conducted without prior approval by the Division of Waste Management. [401 KAR 45:140 Section 1(1), 401 KAR 6:350 Section 12(1)]

7. Groundwater Well Construction: The owner or operator shall comply with the standards and provisions in 401 KAR Chapter 6. This includes, but not limited to, the provision each monitoring well shall be constructed, modified, or abandoned by a monitoring well driller or monitoring well driller assistant certified in accordance with KRS 223.425 and 401 KAR 6:320. [401 KAR 6:350]

8. Groundwater Assessment: Groundwater contamination assessment and corrective action shall be performed in full compliance with all provisions of 401 KAR 45:160 Section 5; the owner or operator shall be required to prepare and submit a groundwater contamination assessment plan if laboratory analyses of one (1) or more public or private water supplies or monitoring wells at the site shows the presence of one (1) or more parameters above the maximum contaminant level (MCL) as specified in 401 KAR 30:031 or a statistically significant increase over background levels for parameters that have no MCL. The owner or operator shall comply with the provisions of this group, referenced as GSTR0002; the data gathered may be used in the groundwater assessment process in accordance with the technical provisions of 401 KAR Chapter 45. The approval of the groundwater assessment plan, referenced as AIN20140001, in no way constitutes Division of Waste Management acceptance or concurrence with any technical provision pursuant to 401 KAR Chapter 46. [401 KAR 45:140 Section 2, 401 KAR 45:160 Section 5]

9. Groundwater Well Construction: The Division of Waste Management shall be notified at least ten (10) working days prior to monitoring well construction, modification, or abandonment so that a Cabinet representative may be present at the construction, modification, or abandonment. [401 KAR 6:350 Section 12]

GSTR0003 - Groundwater Monitoring - SWB: Piezometer Monitoring Group

Group Members: STRC0035 - Well P-9; STRC0037 - Well P-11

Variances, Alternate Specifications and Special Conditions:

1. These piezometers are for monitoring static water levels for groundwater flow determination. [401 KAR 47:160]

GSTR0004 - Groundwater Monitoring - SWB: Chapter 46 Groundwater Monitoring Group

Group Members: AIOO3319 -

Variances, Alternate Specifications and Special Conditions:

1. Groundwater Monitoring: The owner or operator shall monitor groundwater and provide notifications in accordance with 401 KAR Chapter 46 and submit the results and analysis to the Division of Waste Management, Solid Waste Branch upon request. [401 KAR 45:030, 401 KAR 46:110 Section 10, 401 KAR 46:110 Section 8]

PERMIT

GSTR0005 - Groundwater Monitoring - SWB: Chapter 6 Groundwater Monitoring Group

Group Members: AIOO3319 -

Variances, Alternate Specifications and Special Conditions:

1. Groundwater Well Construction: Prior to the installation, modification, or abandonment of a monitoring well at a unit regulated by the Division of Waste Management (DWM), the permittee shall obtain DWM approval of all monitoring-well construction designs and all monitoring-well construction materials. The approval request shall be submitted to the Solid Waste Branch of the DWM. [401 KAR 6:350 Section 12]

2. Groundwater Well Construction: The Division of Waste Management shall be notified at least ten (10) working days prior to monitoring well construction, modification, or abandonment so that a Cabinet representative may be present at the construction, modification, or abandonment. [401 KAR 6:350 Section 12]

3. Groundwater Well Construction: The owner or operator shall comply with the standards and provisions in 401 KAR Chapter 6. This includes, but not limited to, the provision each monitoring well shall be constructed, modified, or abandoned by a monitoring well driller or monitoring well driller assistant certified in accordance with KRS 223.425 and 401 KAR 6:320. [401 KAR 6:350]

4. Reports and Submittals: For recordkeeping purposes and in order to verify compliance with 401 KAR Chapter 6 standards, the owner or operator shall submit a Construction Progress Report (CPR) within 45 days of the completion of any groundwater monitoring well installation, modification, or abandonment activities. [401 KAR 45:140 Section 1(8), 401 KAR 6:350]

RE: Big Rivers Electric Corporation, D.B. Wilson Station Landfill
Response to Comments
Technical Notice of Deficiency (NOD) No. 3
Closure Plan Modification, Post Closure Plan Modification,
and Additional Information
Agency Interest 3319
Application I.D. No. APE20200002
Solid Waste Permit # SW09200004

Dear Mr. Anderson:

Big Rivers Electric Corporation (BREC) maintains and operates a special waste landfill in Ohio County, Kentucky. The special waste landfill is permitted under 401 KAR 45 for disposal of special waste (utility waste such as fly ash, bottom ash, and scrubber sludge per KRS 224.50-760). These wastes are generated by the 440-megawatt D.B. Wilson Power Plant. The landfill exists in two phases, Phase I and Phase II. Attached is the DEP Form 7017 Application for a Minor Modification to a Formal Solid Waste Permit. This permit modification application is being submitted for the Phase I Landfill closure and post-closure plan under the technical requirements of 401 KAR Chapter 45 and the transition of the Phase II Landfill to the applicable requirements of 401 KAR Chapter 46. Big Rivers originally submitted this permit modification application on March 26, 2020. On behalf of BREC, AECOM Technical Services, Inc. (AECOM) prepared the following responses to comments provided by the Kentucky Department for Environmental Protection (KDEP), Division of Waste Management, Solid Waste Branch (KDWM) in their July 2, 2021 Technical Notice of Deficiency No. 3 (TNOD #3) regarding the Closure Plan Modification, Post-Closure Plan Modification, and Additional Information. As previously requested KDWM, the response to the TNOD shall be a new submittal. The information attached to this cover letter can be found in the following order:

Table of Contents

Minor Permit Modification Completed Form

Attachment 1 – Revised Closure Plan

Attachment 2 – Revised Post-Closure Plan

Attachment 3 – Transition Information

Attachment 4 – Updated Closure and Post-Closure Cost Estimates

If you have any questions or require further information, please contact Diana Merritt at (270) 844-5008.

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for such violations."

Subject: Response to Comments
Technical Notice of Deficiency #3 (NOD 3)
Closure Plan Modification, Post-Closure Plan Modification,
and Additional Information Big Rivers Electric Corp. – Wilson Station
Agency Interest No. 3319
Application I.D. No. APE20200002 Ohio County

Dear Mr. Cole,

On behalf of Big Rivers Electric Corporation (BREC) D.B. Wilson Station, AECOM Technical Services, Inc. (AECOM) prepared the following responses to comments provided by the Kentucky Department for Environmental Protection (KDEP), Division of Waste Management, Solid Waste Branch (KDWM) regarding their review of the above-referenced applications dated April 22, 2021. For ease of review, KDEP's Technical Notice of Deficiency #3 (NOD 3) comments are reprinted below in blue bold-italicized text followed by BREC's response in plain black text.

For ease and consistency of review, the response to this NOD 3 shall be a new submittal replacing the former package with following general updates:

- Attachment 1 Revised Closure Plan; Attachment E1; Updated Site Maps

1. ***Response to Tech NOD 2, Comment 2: The veneer seismic stability analysis uses a seismic coefficient (ks) equal to one-half of the crest Peak Ground Acceleration ostensibly based on recommendations provided in Seismic Design Guidance for Municipal Solid Waste Landfill Facilities (EPA/600/R-95/05). However, Section 6 of the report indicates that ks= 0.5 amax/g generally applies to embankments and slopes. Alternatively Section 4 of the report states, "The peak acceleration at the top of the landfill estimated in Step 3 may be used in seismic performance analyses of the landfill cover and surface water drainage systems and in evaluation of other facilities constructed on top of the landfill (e.g., flare station or storage tanks)." Consequently, it appears that the peak acceleration at the crest of the landfill is more appropriate for use in a veneer stability analysis unless adequate justification can be provided for retaining the current seismic coefficient value, pursuant to 401 KAR 45:110 Section 5(2)(e).***

In general, (a) the crest PGA happens at a single instant in time and (b) the ground is not rigid, therefore

motion within the ground varies spatially with peaks happening at different points in time and potentially moving in different directions [Geotechnical Earthquake Engineering (Kramer 1996)].

Specifically, (a) the veneer stability analysis considered a slope configuration typical of the proposed final cover (i.e. 3H:1V slope), (b) along the center profile of the landfill, the crest/top (which is flat) width comprises only about 1/5th of the slope areas, (c) a slope section (3H:1V) is more representative of site conditions, and (d) a flat configuration is less conservative compared to the more representative 3H:1V slope. Therefore, the recommendation in Section 6 of EPA/600/R-95/05 is more appropriate for the calculation of the seismic coefficient as indicated in the current veneer stability analysis.

Following receipt of NOD 3 and subsequent discussions with members of the Kentucky Division of Waste Management, AECOM conducted additional analysis in support of the previously submitted veneer stability analysis. Landfill peak crest acceleration and laboratory interface direct shear testing results were used to evaluate performance of the final cover system.

Interface direct shear testing was performed on representative samples of existing landfill cover soils and proposed Super Gripnet geomembrane as noted in the attached laboratory report provided to Big Rivers by WatershedGeo in a letter report dated January 26, 2021. The site-specific cover materials used in the test were nominally tamped to represent the graded, but relatively uncompacted condition of the cover materials anticipated after preparation of the final grade.

Using the full peak crest acceleration of 0.27g and assuming adhesion is zero (0), the required interface friction angle, between the ClosureTurf Super Gripnet and loose cover soils, was calculated as 33.1 degrees at a factor of safety of 1.0.

Using the laboratory test results, the peak interface friction angle and the adhesion were calculated as 33.6 degrees and 4 psf, respectively. These values were applied to the veneer stability formulations to determine the resulting factors of safety. The results are summarized below.

Table 1. Final Cover Factors of Safety Using Peak Laboratory Results

CONDITION	TARGET FACTOR OF SAFETY	RESULTS
Static (Gravitational Forces Only)	**1.50**	**5.19**
Static (Additional Seepage Forces)	**1.10**	**2.00**
Static (Equipment Loads)	**1.25**	**1.99**
Seismic (Using ½ of Crest PGA =0.135g)	**1.00**	**3.52**
Seismic (Using Full Crest PGA =0.27g)	**1.00**	**2.66**

Laboratory test results also indicated a residual interface friction angle of 31.3 degrees. Results of the residual strength are summarized below.

Table 2. Final Cover Factor of Safety Using Residual Laboratory Results

CONDITION	TARGET FACTOR OF SAFETY	RESULTS
Final Cover - Static	1.10	1.83

In addition, a deformation analysis utilizing the full crest acceleration (0.27 g) and Simplified Seismic Slope Displacement Procedures (Bray, 2007) was performed to evaluate the performance of the ClosureTurf final cover under shallow sliding conditions. Based on the analysis, the estimated displacement of the final cover system under a spectral acceleration of 0.27 g (design earthquake) is on the order of 0.3 cm or 0.12 in. This value is regarded as minimal anticipated displacement. A summary of the calculation is presented as attachment to this response.

Conclusions

The results of the preconstruction interface testing indicate that, even in a loosely compacted condition, the interface strength of the proposed Super Gripnet over the existing cover materials is adequate for long-term stability of the cover system. In addition, minimal seismic induced displacement of the cover system is anticipated at full crest acceleration, indicating that the cover system will not be affected by the maximum calculated seismic effect.

2. ***Response to Tech NOD 2, Comment 17: The Construction Quality Control Plan specifies the cap subbase/subgrade conformance testing measures in Table 3. Table 3 specifies a 6 – 8 inch compacted lift and compaction equipment to be dozer tracks, sheep foot, OR a smooth drum roller. The Veneer Stability Analysis in Attachment G was performed based on Table 1 and Table 2 parameters within the Veneer Stability Analysis report. These parameters are given as 19.2 inch soil layer, assumed 95% compaction MDD, 13.6% moisture content, and 2.7 specific gravity. The Construction Quality Control Plan (CQCP) must be consistent with the Veneer Stability Analysis. Please revise the CQCP accordingly.***

The physical properties of the cover soil (dry density, moisture content, specific gravity, etc.) given in Table 2 were provided as placeholders and in support of Figure 1 and Table 1, but do not enter directly into the stability calculations for the veneer, and are therefore not criteria for the actual installation of the Super Gripnet/liner system. The driving load for veneer stability consists only of the ClosureTurf and sand infill layer. Arbitrary reference to compaction parameters not applicable to the veneer stability analysis have been removed from the calculation package.

The purpose of the veneer stability analysis is to calculate the minimum interface strength properties between the Super Gripnet membrane layer and the underlying cover soil. Results of the analysis indicated a required minimum peak interface friction angle, between Super Gripnet and existing cover soil, of 26.5 degrees and 0 psf adhesion under gravitational forces, representing a factor of safety of 1.50.

Laboratory interface direct shear testing was performed on representative samples of the existing landfill cover soils and the proposed Super Gripnet geomembrane. The cover soil material was nominally tamped in place (to conservatively represent the material to be in a loose condition in the field) for the tests. The

lab testing resulted in a peak friction angle of 33.6 degrees and adhesion of 4 psf. Plugging the laboratory friction angle and adhesion values into the veneer stability formulas for gravitational forces results in a factor of safety of 5.19, greatly exceeding the target of 1.50.

For the vast majority of the site, topsoil will be stripped and the membrane will be placed directly on the remaining, in-place protective cover soil, which averages 19.2 inches in thickness. If, and where necessary to further prepare the subgrade surface, protective cover soil will be placed in a 6 to 8 inch loose lift and compacted by dozer tracks, sheepsfoot or smooth drum roller. Based on the laboratory interface direct shear test results, it was concluded that even in a loose condition, the existing cover soils and any cover soil placed to create the subgrade surface will provide adequate interface strength in conjunction with the proposed Super Gripnet product.

3. ***Response to Tech NOD 2, Comment 20, Attachment E2 (Site Maps 1 and 1A): Submit a legible site map that exactly matches the EPA SWMM 5.1 data entries. The applicant uses an 8.5" x 11" base image for a watershed map that has forty-six (46) subwatersheds, resulting in poor legibility of the information contained within.***

The figures have been revised. The visual quality of the figure is limited by the abilities of the software.

For completeness, the responses to the initial NOD are also included in this re-submittal package. If you have any questions or comments regarding this matter, please do not hesitate to contact us.

Yours sincerely,

Subject: Response to Comments
Technical Notice of Deficiency #2 (NOD 2)
Closure Plan Modification, Post-Closure Plan Modification,
and Additional Information Agency Interest No. 3319
Application I.D. No. APE20200002 Ohio County

Dear Mr. Berry,

On behalf of Big Rivers Electric Corporation (BREC) D.B. Wilson Station, AECOM Technical Services, Inc. (AECOM) prepared the following responses to comments provided by the Kentucky Department for Environmental Protection (KDEP), Division of Waste Management, Solid Waste Branch (KDWM) regarding their review of the above-referenced applications dated April 22, 2021. For ease of review, KDEP's Technical Notice of Deficiency #2 (NOD 2) comments are reprinted below in blue bold-italicized text followed by BREC's response in plain black text.

For ease and consistency of review, the response to this NOD 2 shall be a new submittal replacing the former package with following general updates:

- Attachment 1 Revised Closure Plan; Attachment D Revised CQA Plan
- Attachment 1 Revised Closure Plan; Attachment E1; Updated Site Maps
- Attachment 1 Revised Closure Plan; Attachment G Revised Veneer Stability Analysis.
- Attachment 1 Revised Closure Plan; Attachment G1 Revised DSHA
  - Added Sample DEEPSOIL Output file.
- Attachment 1 Revised Closure Plan; Attachment G2; Added Abrahamson, N., Addo, K., and Silva, W., 2020, Hard-rock to soft-rock site factors for NGA-East
- Attachment 1 Revised Closure Plan; Attachment H; Updated Drawings 103, 104, 105, 106, 107, 112.

1. ***Response to Technical NOD, Comment 6: The veneer stability analysis with pore pressure contained in Attachment A, Detailed Calculations, assumes a water depth equal to 1/3 of the thickness of the Hydroturf. Show that all components of the surface drainage system, including the Hydroturf with sand infill, have sufficient capacity to maintain this depth for the design storm maximum precipitation intensity pursuant to 401 KAR 45:110 Section 5(2)(e).***

The water depth equal to 1/3 of the thickness of the sand infill was selected as a conservative representation, however the Sand Infill Hydraulics Calculations of Scenario 2, where a similar side slope configuration was considered, concluded that the drainage capacity of the underlying Super Gripnet was greater than the calculated flow rate from the design maximum storm water event. Hence, the sand infill layer is not expected to be saturated with free water or generate a hydraulic load during a storm water event, as such a more representative water depth would be zero. The veneer stability analysis (60631499_D.B. Wilson Phase I_Veneer Stability Analysis_Revised_05.26.21.pdf) has been updated to reflect zero (0) hydraulic head in the sand infill, and the revised sand infill hydraulics calculations are provided as an attachment to the Veneer Stability Analysis.

2. ***Response to Technical NOD, Comment 6: The veneer stability analysis spreadsheet contained in Attachment A, Detailed Calculations, uses a seismic coefficient of 0.201 defined as the MCE with 2% exceedance in 50 years. However, Attachment C calculates a seismic coefficient of 0.201 based on relationships contained in Figures 1 and 2. Provide additional explanation on the procedure used to calculate the seismic coefficient for the veneer stability analysis pursuant to 401 KAR 45:110 Section 5(2)(e).***

A semi-empirical procedure was used for determining the coefficient of 0.201g. Details and explanation of the procedure used for determining were included as an Attachment C to the Veneer Stability Analysis. In response to this comment, AECOM has re-evaluated the veneer stability analysis for the site-specific hazard analysis and using the EPA guidance presented in Publication EPA/600/R-95/05 (Richardson, et al., 1995) titled "RCRA Subtitle D (258) Seismic Design Guidance for Municipal Solid Waste Landfill Facilities" to limit permanent seismic deformations to less than 1-foot. Per this guidance, a seismic coefficient of ½ the crest PGA from SHA can be used. As such, the re-evaluation has resulted in a seismic coefficient of 0.135g (i.e., landfill crest PGA from SHA divided by 2 – 0.27g/2) which is less than the conservative 0.201g obtained from the semi-empirical approach. Though the coefficient using the EPA approach is lower, it is considered more representative, and the veneer stability analysis has been updated using a seismic coefficient of 0.135g.

3. ***Response to Technical NOD, Comment 6: Attachment C apparently calculates a seismic coefficient for a sliding mass depth equal to the height of the structure. Provide justification for applying this seismic coefficient to a veneer stability analysis or provide a revised stability analysis pursuant to 401 KAR 45:110 Section 5(2)(e).***

Per the semi-empirical approach, the analysis was conducted on a typical slope geometry of 3H:1V slope and height of 30 feet and assumed failure of that slope configuration in a design seismic event. As explained above in point 2, this approach yielded a more conservative seismic coefficient compared to the EPA Publication EPA/600/R-95/05 approach. Though the coefficient using the EPA approach is lower, it is considered more representative, and the veneer stability analysis has been updated using a seismic

coefficient of 0.135g.

4. ***Response to Technical NOD, Comment 7: The site-specific seismic hazard analysis (6.3 Analysis Results) generated peak ground acceleration (PGA) values of 0.27g at the crest, 0.31g at the base of the crest, and 0.34g at the toe of the fill. Attachment C (Seismic Coefficient) determined a PGA at the crest of approximately 0.59g. Provide additional explanation for the different PGA values for the crest determined in the seismic analysis and Attachment C pursuant to 401 KAR 45:110 Section 5(2)(e).***

The veneer stability analysis has been revised with the updated seismic coefficient. The selected seismic coefficient was based on one half of the crest PGA, as determined from the site hazard analysis, in accordance with the guidance presented in the EPA Publication EPA/600/R-95/05 (Richardson, et al., 1995) titled "RCRA Subtitle D (258) Seismic Design Guidance for Municipal Solid Waste Landfill Facilities" to limit permanent seismic deformations to less than 1-foot. The revised veneer stability analysis is attached.

5. ***Response to Technical NOD, Comment 7: Section 3.2 of the site-specific seismic hazard analysis (Ground Motion Prediction Models) does not provide sufficient information on implementing the ground motion models. Provide additional explanation on implementation of the NGA-East ground motion models, including any databases or software used pursuant to 401 KAR 45:110 Section 5(2)(e).***

As presented in Section 4 of the revised Site-Specific Seismic Hazard Analysis Report, calculations were made using the NGA-East ground-motion characterization tool developed by The B. John Garrick Institute for the Risk Sciences, UCLA Engineering, Natural Hazards Risk and Resiliency Research Center, a link to the tool is provided: https://www.risksciences.ucla.edu/nhr3/gmtools. The weighted average ergodic sigma model was used in calculating the 84th percentile (median plus one sigma).

6. ***Response to Technical NOD, Comment 7: In Attachment G1 (4.0 DSHA Results) include PGA values in Table 2 (5%-Damped Horizontal Spectra). Add a footnote or other appropriate designation indicating the spectral accelerations are for a site shear wave velocity, Vs30 = 855 m/s, pursuant to 401 KAR 45:110 Section 5(2)(e).***

The title of Table 3 in the revised Site-Specific Seismic Hazard Analysis Report (DBWilson_SHA-05112021.pdf) indicates the spectral accelerations are for a Vs30 = 855 m/s.

7. ***Response to Technical NOD, Comment 7: In Attachment G1 (4.0 DSHA Results) add a table to the seismic analysis giving the 5%-damped horizontal spectra and PGA at the NGA-East base shear wave velocity Vs30 = 3000 m/s for the median, minus one standard deviation, and plus one standard deviation, pursuant to 401 KAR 45:110 Section 5(2)(e).***

Table 2 was added to Section 4 in the revised Site-Specific Seismic Hazard Analysis Report providing the 5%-damped horizontal spectra for a Vs30 = 3000 m/s for the median, minus one standard deviation, and plus one standard deviation for the three sources considered.

8. ***Response to Technical NOD, Comment 7: In Attachment G1 (6.2 Dynamic Material Properties), references for G/Gmax and damping were given, but the values were not included. Include G/Gmax and damping values in the application either in tabular or graphical format pursuant to 401 KAR 45:110 Section 5(2)(e).***

The Modulus Reduction and Damping curves used were added as Figure 22 and referenced in Section 6.2 in the revised Site-Specific Seismic Hazard Analysis Report

9. ***Response to Technical NOD, Comment 7: In Attachment G1 (6.3 Analysis Results) a printout for the program DEEPSOIL was not found. Provide a representative printout for the dynamic site response analysis program DEEPSOIL pursuant to 401 KAR 45:110 Section 5(2)(e).***

Appendix A has been added to the revised Site-Specific Seismic Hazard Analysis Report to add the input files which are referenced in Section 6.3. Additionally, a sample of the output for one representative case and motion was added to the DSHA (Sample DEEPSOIL Output.pdf) for reference.

10. ***Response to Technical NOD, Comment 7: Under Attachment G1 (8.0 References) provide a copy of the paper: Abrahamson, N., Addo, K., and Silva, W., 2020, Hard-rock to soft-rock site factors for NGA-East: in preparation, pursuant to 401 KAR 45:110 Section 5(2)(e).***

A pre-print copy of the paper: Abrahamson, N., Addo, K., and Silva, W., 2020, Hard-rock to soft rock site factors for NGA-East is provided (Abrahamson 2020.pdf). (Note: It is AECOM's understanding the paper is currently in review to be published in Seismological Research Letters).

11. ***Response to Technical NOD, Comment 16: In the CQA Plan, 8.1.2 References, the title for GRI-GM17 does not agree with the listed Geosynthetic Research Institute title. Please correct the title.***

The title has been corrected in the revised CQA Plan to match the GRI title.

12. ***Response to Technical NOD, Comment 16: Table 4 in the CQA Plan specifies 60 mil LLDPE, and Table 5 lists 50 mil textured LLDPE. Drawing detail 2/300 on Drawing Sheet BGR-WCP-300 shows 50 mil HDPE or LLDPE. The veneer stability analysis, Sheet 2 of 12 Figure 1 shows 50 mil HDPE. Please provide consistency in the FML specifications.***

The title of Table 4 has been corrected to 50-mil, labels and call outs have been corrected and made consistent. Detail 2/300 on Drawing Sheet BGR-WCP-300 is correct. AGRU 50-mil LLDPE has been submitted for and approved for the Closure Turf geomembrane component.

13. ***Response to Technical NOD, Comment No. 16: In the Construction Quality Control Plan, please state that field deviations or alterations have been approved. DWM approval must be sought and obtained prior to commencing of the deviation or alteration work per 401 KAR 45:110 Sections 2 and 5. The Construction Progress Report may not be found acceptable if this action is not completed. Please make note field deviations shall be specified in the Construction Progress Report.***

The statement has been added in the revised CQA Plan, see section 3.5.2.1.

14. ***Response to Technical NOD, Comment No. 16: In the Construction Quality Control Plan, please state the Construction Progress Report will contain all necessary conformance testing for each type of synthetic utilized per 401 KAR 45:110 Sections 2 and 5. This is to ensure the synthetic material used met project specifications.***

The statement has been added in the revised CQA Plan, see section 3.5.1.

15. ***Response to Technical NOD, Comment No. 16: In the Construction Quality Control Plan, please state that any failed area, where test results demonstrate that the area does not meet project specifications or regulatory requirements, must be reworked or repaired until the area passes per 401 KAR 45:110 Sections 2 and 5.***

The statement has been added in the revised CQA Plan see section 3.6.

16. ***Response to Technical NOD, Comment No. 16: In the Construction Quality Control Plan, please remove the Submittals (3.9, 3.9.1, and 3.9.2) and Request for Information (3.10) sections as these sections do not involve DWM and should not be included in the permit application.***

The noted items have been removed in the revised CQA Plan.

17. ***Response to Technical NOD, Comment No. 16: In the Construction Quality Control Plan, please provide a conformance testing measure for the cap subbase per 401 KAR 45:110 Section 1(10).***

Conformance testing for the sand and subbase have been added, see Table 3 in the CQA Plan. Also, subgrade preparation requirements have been added to Table 3.

18. ***Response to Technical NOD, Comment No. 16: In the Construction Quality Control Plan, please state DWM will be contacted when each cap component is completed so that a DWM representative may inspect the cap component prior to the next component being installed per 401 KAR 45:110 Section 5. Please provide DWM a minimum of a two (2) working day notice for the inspection to be scheduled.***

The statement has been added in the revised CQA Plan, see section 3.5.

19. ***Response to Technical NOD, Comment No. 20: The Closure Cost Estimate for Phase 1 was submitted, however the Closure Cost Estimate for Phase II was not found. Please submit an itemized Closure Cost Estimate for Phase II as required by 401 KAR 46:110 Section 9.***

The Phase II cost estimate was included in the previous NOD (Jan. 2020) submittal (pg. 804 of the PDF), attached again here for reference. Bookmarks have been added for easier searching.

20. ***Attachment E2: Submit a legible site map that exactly matches the EPA SWMM 5.1 data entries.***

The site map has been updated to more clearly match the data entries.

21. Attachment H (Wilson Phase I Landfill Closure Plan): The axis labels on fill cross sections are largely illegible due to overlapping lettering. Please adjust the font and or graph size to make the axis labels legible.

The Attachment H drawings have been updated to improve legibility.

For completeness, the responses to the initial NOD are also included in this re-submittal package.

If you have any questions or comments regarding this matter, please do not hesitate to contact us.

Yours sincerely,

Subject: Response to Comments
Technical Notice of Deficiency (NOD)
Closure Plan Modification, Post-Closure Plan Modification,
and Additional Information Agency Interest No. 3319
Application I.D. No. APE20200002 Ohio County

Dear Mr. Berry,

On behalf of Big Rivers Electric Corporation (BREC) D.B. Wilson Station, AECOM Technical Services, Inc. (AECOM) prepared the following responses to comments provided by the Kentucky Department for Environmental Protection, Division of Waste Management, Solid Waste Branch (KDWM) regarding their review of the above-referenced applications dated August 31, 2020. For ease of review, KDEP's Technical Notice of Deficiency (NOD) comments are reprinted below in bold-italicized text followed by BREC's response in plain text:

1. General Comment: For ease and consistency of review, the response to this NOD shall be a new submittal replacing the previous information in its entirety and be in the following order:

- ***a) Cover letter;***
- ***b) Table of contents;***
- ***c) Completed form;***
- ***d) Attachment 1 – the revised closure plan, with sub-attachments, appendixes, sections, etc. as needed;***
- ***e) Attachment 2 – the revised post-closure plan, with sub-attachments, etc. as needed;***
- ***f) Attachment 3 – transition information in accordance with 401 KAR Chapter 46 technical requirements; and***
- ***g) Attachment 4 – Updated Closure and Post-Closure Cost Estimates, incorporating new Chapter 46 provisions.***

1. As requested, the response to this NOD is in the form of a new submittal replacing the previous information in its entirety using the prescribed order. BREC anticipates that the listed closure and post closure plan items pertain specifically to Phase I of the landfill and not to Phase II, with the exception of the cost estimates being provided for the purpose of financial assurance.

DWM has the following comments, grouped in the 3 submitted parts: Closure Plan Modification; received on February 28, 2020

2) ***General Comment: A closure plan modification application is a separate permitting action from actions specific to groundwater monitoring, groundwater assessment, and groundwater remedial measures. This action should not include any groundwater remedial actions or be combined with a groundwater remedial action plan; please submit any groundwater monitoring, assessment, and remedial measures actions separately.***

2) BREC understood from our November 8, 2019 meeting in Frankfort that it was KDWM's strong recommendation that the efforts should be combined. BREC will separate groundwater issues from the Closure Plan modification.

3) ***General Comment: All drawings and maps must be sealed, signed, and dated by a licensed Professional Engineer in the Commonwealth of Kentucky pursuant to KRS Chapter 322.***

3) Any drawings and maps that were not sealed, signed, and dated by a licensed Professional Engineer in the Commonwealth of Kentucky is rectified in this re-submittal.

4) General Comment: The section entitled "Statement of Qualification and Limitations" is an agreement between the consultant and permittee for the work performed and is therefore superfluous and should not be included in the application. Please do not include this section.

4) "Statement of Qualification and Limitations" has been removed from the revised closure plan.

5) Section 2.3, Waste Estimates Amount: Please add a footnote to clarify the reason for not including 2011-2019 data in Table 1.

5) Wilson Phase I Landfill stopped receiving waste in 2010. A footnote to that effect has been added below Table 1.

6) Section 5.3, Veneer Stability Analysis: The narrative states, "prior to installation of the cap, direct shear testing will be conducted to confirm the factor of safety against sliding" for critical interfaces. Although providing confirmation testing prior to installation is acceptable, the application does not contain an interface stability analysis that can be used for determining if interface friction angles are adequate. In a separate sub-attachment within the closure plan, provide a cap membrane static and seismic stability analysis including a static analysis incorporating the additional load generated by the design 25- year, 24-hour storm event. Specifications for submitting the cap interface confirmation testing should be included in the construction quality control plan, further discussed in Comment 16, pursuant to 401 KAR 45:110 Section 5(2)(e).

6) For a final closure cap (including ClosureTurf), veneer stability analysis has been conducted for both static (including considering additional load generated by the design 25-year 24-hour storm event) and seismic conditions. Static and seismic stability conditions were analyzed for the two critical interfaces consisting of woven geotextile over geomembrane and geomembrane over existing cover soil.

Based on the veneer stability analysis results on the proposed final cover system, the factor of safety for the seismic loading condition controls the interface friction between the geomembrane and existing cover soil utilizing peak strengths. Results of the stability analysis are included in Attachment G. This factor of safety will be confirmed by conducting interface direct shear testing per ASTM D5321 prior to commencing cap construction.

7) ***<u>Section 5.3, Veneer Stability Analysis</u>: Acceleration for the seismic stability analysis should be developed using a site-specific, scenario-based deterministic seismic hazard analysis pursuant to 401 KAR 45:110 Section 5(2)(e).***

7) Borings were completed at the toe and crest of landfill to investigate subsurface materials including landfill CCR, mine spoil, and top of bedrock. Bedrock was encountered within the toe boring at approximate depth of 38.5 feet below existing grade. Bedrock consisted of shale, partly interbedded with limestone.

Multichannel analysis of surface waves (MASW) investigation was performed at the DB Wilson Phase I site to determine shear wave velocities (Vs) of onsite bedrock. MASW data were collected at the toe and crest of the landfill and centered on the previously completed test borings. Results of the MASW was used to determine the Vs of the upper 100 feet at the toe and crest of the landfill.

Deterministic seismic hazard analysis (DSHA) was performed for the bedrock underlying the DB Wilson Phase I landfill site. Three earthquake sources were considered in the DSHA, namely the Wabash Valley Seismic Zone; the New Madrid Seismic Zone; and a background(random) earthquake, for determination of time histories (84th percentile 5%-damped acceleration response spectra).

Results indicate the Wabash Valley seismic zone gives the highest spectral accelerations for periods less than 0.1 sec, while the New Madrid seismic zone gives highest spectral acceleration for periods greater than 0.1 sec. Subsequently, a site response analysis was completed to develop ground surface response for both landfill base and crest. Information utilized for the development of site-specific response spectra included time histories, borings, laboratory testing data, bedrock Vs data from MASW, dynamic material properties, and published data.

The peak ground acceleration at the base of the landfill was utilized for the determination of the pseudo-static coefficient, which is used in the seismic condition of the veneer stability analysis.

Results of the stability analysis are included as Attachment G to the revised closure plan. The DSHA is included as Attachment G1.

8) ***<u>Attachment B, Laboratory Testing (Appendix A)</u>: Table 1 only contains half of the Description column. If applicable to the response, please correct this issue.***

8) Unfortunately, this truncation of the table dates back to a copy made from a fax from a previous consulting firm sent in 1993, and the original table is not available in BREC records. However, based on the partial content and the expected terms, AECOM offers that the Description column should read:

- Filter cake batch number
- Composition (FA/FC)
- Lime added (bag)
- Free lime (fly ash)
- Total lime
- Sample age
- % Solids (molding)
- % moisture content % at molding
- Liner testing
- Density (wet)
- Density (dry)
- Unconfined strength (psi)
- Permeability (cm/sec x $10^{-5)}$
- Leak test
- Consolidation

- Triaxial shear

A newly constructed page with this information is included in Attachment B.

9) Attachment E, Hydrology Evaluation: Please enclose the EPA-SWMM input/output data files, in a table format if available. Please ensure that the modeling characteristics/properties matches the ClosureTurf's. The modeling must match the sub- catchment map's flow paths.

9) The EPA-SWWM input/output data can be found in Attachment E2.

10) Attachment E, Hydrology Evaluation: Provide a detailed printout for the EPA-SWMM analysis including drainage area, method and parameters for determining rainfall excess, method and parameters for overland flow routing, method and parameters for channel routing, and a watershed and channel connectivity map. The analysis should also include reservoir routings for the two detention ponds used in the design per 401 KAR 45:110 Section 5(2)(e).

10) The detailed printout of the EPA-SWMM analysis can be found in Attachment E2. The following is a list of key notes and assumptions made in completing the H&H analysis:

- The rainfall depths for Island, Kentucky of 5.90 inches for the 24-hour, 25-year storm was obtained from NOAA Atlas 14 and can be found in Attachment E1.
- Swales along the benches were designed based on the worst-case velocity and depth among the selected candidates in order to be conservative.
- The complete hydrology and hydraulics evaluation can be found in Attachment E: H&H Design.

11) Attachment E, Hydrology Evaluation: Provide drawings for the detention ponds used in the design per 401 KAR 45:110 Section 5(2)(e).

11) Detention Pond drawings can be found in Attachment E3.

12) Attachment E, Hydrology Evaluation: Provide a design for the benches/benches demonstrating adequate capacity to convey flow to the flumes that carry stormwater off the landfill per 401 KAR 45:110 Section 5(2)(e).

12) The benches properly control and convey the water volume generated by the 24-hour, 25-year storm such that the average flow depth stays safely below the impounding side slopes. Design values for each hydraulic conveyance feature are summarized in Attachment E Tables 1-5. A channel lining of KYTC No. 57 was chosen for all benches. Design values for each hydraulic conveyance feature are provided in Attachment E2, in the section labeled *Erosion Check*.

13) Attachment E, Hydrology Evaluation: Provide a design for the stormwater flumes at bench crossings including hydraulics and a drawing detail with profile pursuant to 401 KAR 45:110 Section 5(2)(e).

The flumes properly control and convey the water volume generated by the 24-hour, 25-year storm such that the average flow depth stays safely below the impounding side. A channel lining of ClosureTurf (HydroBinder) is proposed for all stormwater flumes. ClosureTurf with HydroBinder has a maximum design flow velocity of 29 ft/sec and maximum design shear stress of 8.8 psf as stated on the manufacturer's product data sheet (see Table 4 in Attachment D). Rock check dams will be installed across the flume at each bench landing to minimize hydraulic jump issues during

high flow rain events. A profile and section of the landings where the flumes intersect the benches (Sections A-A and B-B on Sheet 303. Design values for each hydraulic conveyance feature are summarized in Attachment E Tables 1-5. Design values for each hydraulic conveyance feature are provided in Attachment E2, in the section labeled *Erosion Check*.

14) Attachment E, Hydrology Evaluation: Provide a channel lining erosion design for the stormwater flumes and perimeter ditches per 401 KAR 45:110 Section 5(2)(e).

14) The perimeter ditches will collect landfill run-off which is conveyed to the sediment basins. A channel lining of ClosureTurf (HydroBinder) is proposed for all stormwater flumes and perimeter ditches as the peak velocity and the actual shear are less than the performance limits of ClosureTurf with HydroBinder, as stated in the manufacturer's product data sheet found in Attachment D. The results of the channel lining erosion design can be found in Attachment E, Tables 1-5.

15) Attachment E, Hydrology Evaluation: Provide an erosion analysis for the ClosureTurf sand infill for site conditions at the design 25-year, 24-hour storm event per 401 KAR 45:110 Section 5(2)(e).

15) Calculations utilizing site specific parameters to estimate hydraulic shear from rainfall runoff and its impact on hydraulic stability of the sand infill are provided in Attachment E4. The purpose of the calculations is to evaluate whether the calculated maximum hydraulic shear stress in the sand infill of ClosureTurf exceeds the critical hydraulic shear stress. Three drainage scenarios are evaluated in the following calculations. The calculation results are summarized in Table 1 below. The calculated maximum hydraulic shear stress in the sand infill is less than the critical hydraulic shear stress, indicating minimal sand infill mobilization is expected to occur.

Table 1. Summary of Hydraulic Calculation Results

Analysis Scenario	Calculated Max. Hydraulic Shear Stress using Super Gripnet® on Top Deck (psf)	Calculated Max. Hydraulic Shear Stress using Super Gripnet® on Side Slope (psf)	Suggested Critical Hydraulic Shear Stress (psf)	Hydraulic Shear Stress (Pass or Fail)
Scenario 1: 55 ft of top deck at 5% slope and 68 ft of side slope at 3.25H:1V	0.0 (Total flow on the top deck is less than the internal drainage capacity of Super Gripnet)	0.0 (Total flow on the slope is less than the internal drainage capacity of Super Gripnet)	0.8	Pass
Scenario 2: 156 ft of side slope at 3.4H:1V	-	0.0 (Total flow on the slope is less than the internal drainage capacity of Super Gripnet)		Pass

Scenario 3: 365 ft of side slope at 6H:1V	-	0.26		Pass

16) ***<u>General Comment</u>: Provide a complete construction quality control plan including, but not limited to, specifications for the geosynthetics soil base placement, material properties and installation for all geosynthetics, material properties and installation for all other construction elements such as channel linings, a preconstruction meeting, and preparation of a final construction progress report per 401 KAR 45:110 Section 2. The construction quality control plan should also provide two (2) day notice to DWM for conducting inspections at critical phases of construction including, but not limited to, the geosynthetics soil base placement, geomembrane installation, ClosureTurf installation, and final inspection.***

16) The Construction Quality Assurance (CQA) plan is included as Attachment D, and incorporates the notice to KDWM for inspections at all critical phases.

17) ***<u>Closure Plan Narrative</u>: For leachate, mill spray, and sediment from ponds and ditches; the quantities are not listed, nor are the characteristics clear.***

17) Sections 3.1 and 3.2 of the Closure Plan are updated to include the best available understanding of quantities and characteristics of listed materials. The available data do not suggest any particular area of Phase I as requiring focused attention or a different corrective action.

<u>Post-Closure Modification; received on February 28, 2020</u>

18) ***<u>General Comment:</u> The narrative states, "Under competition of the implementation of an approved closure plan…"; DWM believes this should be "completion".***

18) KDWM is correct. The typographical error has been corrected. The revised post closure plan for Phase I is included as Attachment 2.

<u>Additional Information; received March 27, 2020</u>

19) ***<u>General Comment</u>: In accordance with the new technical requirements of 401 KAR Chapter 46, it is appropriate to include professional certifications associated with the fugitive dust control plan; the run-on and run-off control system plan; and the groundwater monitoring system and statistical methods. Do not include any of the supporting documentation and/or demonstration documents in the submittal; only include the single or two (2) page professional certification(s).***

19) The various certifications required by Chapter 46 are included in Attachment 3.

20) ***<u>Closure and Post-Closure Cost Estimate – the following should be included in the Closure and Post-Closure Estimate submitted in the future Attachment 4</u>:***

- ***a) Please provide the site-wide closure amount for all activities;***
- ***b) Please provide the site-wide post-closure amount for all activities;***
- ***c) Estimates should be itemized and containing unit prices for each component of closure and post-closure;***

d) Estimates shall be sealed, signed, and dated by a licensed Professional Engineer in the Commonwealth of Kentucky pursuant to KRS Chapter 322;

e) The Phase I landfill in accordance with 401 KAR Chapter 45 technical requirements has a minimum five (5) year Post-Closure period, and the Phase II landfill in accordance with 401 KAR Chapter 46 technical requirements has a minimum thirty (30) year Post-Closure period.

20) Revised closure and post closure cost estimates for both phases of the landfill are included in Attachment 4.

If you have any questions or comments regarding this matter, please do not hesitate to contact me.

Application for a Minor Modification To a Formal Solid Waste Permit Form DEP 7017 (6/10)

Statutes and regulations may be viewed online at the following website address: http://www.lrc.ky.gov/search.htm

Solid waste application forms are available at the following website address: http://www.waste.ky.gov

DWM OFFICAL USE ONLY

AI#: _____ **Application #:** _____

GENERAL INSTRUCTIONS

1. **APPLICABILITY – This form must be completed and submitted to the Cabinet by persons who propose to apply for a minor modification of a formal permit.**

2. **ASSISTANCE – Questions regarding this form may be directed in writing to the Division of Waste Management (DWM), Solid Waste Branch at the address listed above, or by calling 502-564-6716.**

3. **SUBMISSION – Please type or print legibly in permanent ink. Submit the original and two (2) copies of the completed form to the DWM at the address listed above. If an item is not applicable, write "N/A" in the space provided.**

4. **FEES - Applicants must submit the appropriate filing fee at the time of application submittal in accordance with 401 KAR 47:090, Section 2.**

5. **LAWS AND REGULATIONS – Applicants are expected to understand and comply with all laws and regulations applicable to the facility.**

To assist you in the submittal of a complete and accurate application, the Division has identified the most common errors found during the review process. These errors are listed below for your convenience.

1. **Failure to provide the appropriate fee. See 401 KAR 47:090, Section 2. (6)(a).**

2. **Failure to complete the application.**

3. **Failure to comply with public notice requirements. See KRS 224.40-310 and 401 KAR 47:140, Section 7 for more information.**

4. **Failure to comply with Financial Assurance requirements. If the existing financial assurance is insufficient to fully cover current closure and post-closure costs, updates will be required.**

5. **Failure to properly sign and notarize the application. An individual with signature authority for the applicant as defined by KRS 224.01-010(44) and 401 KAR 47:160 must sign and notarize the appropriate signature sections of the application.**

6. **Failure to provide appropriate, fully completed attachments. Maps, drawings, narratives or any attachments that lack sufficient detail or drawings that are not signed, dated and sealed by a professional engineer or geologist may cause delays in the review and approval of the application.**

Warning! Due to the potential for identity theft, do not provide social security numbers to the DWM as part of this application. If this information is required during the normal course of review of the application, a cabinet representative will contact the appropriate individual to acquire this information in a secure format.

Application for a Minor Modification to a Formal Solid Waste Permit

Attachments and Descriptions

38. Type of modification you are seeking:

- ☐ A vertical expansion of less than two (2) years
- ☐ A Groundwater Assessment Plan
- ☐ A Groundwater Corrective Action Plan
- ☐ A modification to the Groundwater or Surface Water Monitoring Plan
- ☐ A modification to the sediment pond design
- ☐ A modification to the alternate daily cover
- ☐ A modification to the leachate collection system
- ☐ A modification to the Closure Plan
- ☐ A modification to change the name of the owner or facility
- ☐ A modification to change the closure or post closure cost estimate
- ☐ A modification to change the permit boundary other than waste boundary
- ☒ Other (describe): Permit modification for the closure and post-closure plan for the Phase I Landfill under the technical requirements of 401 KAR Chapter 45 and transition of the Phase II Landfill to the applicable requirements of 401 KAR Chapter 46.

39. Provide, as **Attachment 1,** a detailed description of the permitting action you are seeking.

40. Provide, as **Attachment 2,** appropriate drawings, calculations, maps, cross-sections, etc.

Certification

41. Pursuant to 401 KAR 47:160, Section 6, a person with signature authority such as a sole proprietor, owner, partner, corporate officer, plant manager, LLC member, mayor, county judge executive or other authorized official must sign this certification statement.

NOTE: Consultants may not sign the following certification statement.

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for such violations."

Name of Person Signing (type or print): Tracy Cole

Title of Person Signing: Plant Manager Date: 6 - 2 - 2021

Signature per 401 KAR 47:160: Tracy Cole

Subscribed and sworn to before me this 2nd day of June, Year 2021

Notary Public Signature: Jney Fulks

State of KY County of Ohio My commission expires: 11-8-2024

Attachment 1

Big Rivers Electric Corporation (BREC) maintains and operates a special waste landfill (AI 3319, Solid Waste Permit # SW09200004) in Ohio County, Kentucky. The special waste landfill is permitted under 401 KAR 45 for disposal of special waste (utility waste such as fly ash, bottom ash, and scrubber sludge per KRS 224.50-760). These wastes are generated by the 440-megawatt D.B. Wilson Power Plant. The landfill exists in two phases, Phase I and Phase II. The application for a permit modification is being submitted for the Phase I Landfill closure and post-closure plan under the technical requirements of 401 KAR Chapter 45 and the transition of the Phase II Landfill to the applicable requirements of 401 KAR Chapter 46. Attached is the $500 permit modification fee required under 401 KAR 45:250 (Attachment 1a).

The Phase I landfill is subject to the standards of 401 KAR Chapter 45. Phase I is constructed with a liner and a cap meeting the specifications of a special waste landfill subject to 401 KAR Chapter 45. Phase I landfill acreage has varied in historical permits but recent mapping by Associated Engineers, Inc. has determined the area to be 94.29 acres (Attachment 1b). The Phase I acreage, as determined by Associated Engineers, includes portions of extended cover and run-off ditches along the eastern boundary of the landfill. Phase I landfill ceased receiving waste and began closure in 2012. The closure plan identifies 103 acres to be covered with an engineered synthetic turf cap and geomembrane. The closure plan area includes lining of the landfill perimeter ditches and extended cover in the northeast and southwest.

The Phase II landfill is identified within the special waste permit as applicable to 401 KAR Chapter 45. This application for permit modification is additionally intended to transition the Phase II landfill to the applicable requirements of 401 KAR Chapter 46. Phase II was constructed with a liner and cap meeting the specifications of a special waste landfill subject to 401 KAR Chapter 45. The Phase II Landfill began receiving waste and the entire footprint of the landfill received waste prior to the October 19, 2015 effective date of 40 CFR 257 (CCR rule). Associated Engineers, Inc. has determined the Phase II area to be 91.83 acres (Attachment 1b). Phase II continues to receive waste from the Wilson Station and is subject to the applicability of 401 KAR Chapter 46. Capping of the Phase II landfill has met the standards of 401 KAR Chapter 46 since the effective date and closure capping will meet the standards of 401 KAR Chapter 46. The closure plan cost estimate identifies 101 acres to be covered which includes lining of the landfill perimeter ditches. The closure and post closure cost estimates for both landfill phases is attached (NOD Response Attachment 4 – Updated Closure and Post-Closure Cost Estimates).

Established in the applicability of 401 KAR 46, 40 CFR 257.107 of the CCR rule requires a publicly accessible internet site containing the information specified by the CCR rule. Big Rivers Electric Corporation maintains the CCR rule compliance and data information website at http://www.bigrivers.com/environmental-services/big-rivers-electric-corporation-ccr-rule-compliance-and-data-information/. CCR landfill required plans with Professional Engineer certifications are located on the website. Attached are certified copies of the 40 CFR 257.91 Groundwater Monitoring System and 40 CFR 257.93 Statistical Method, 40 CFR 257.80 Fugitive

Dust Control Plan and 40 CFR 257.81 Landfill Run-on and Run-off Control Plan (NOD Response Attachment 3 – Transition Information).

A map of the facility's waste boundary and bonded areas determined by R. W. Beck and Associates as submitted in permit application #81-63 to the Division on March 16, 1984 is attached (Attachment 1c). The facility landfill boundary is the permitted 700 acre area as summarized in the permit and identified in the attached maps by R. W. Beck and Associated Engineers. Only bond area 1, Phase I, and bond area 2 of Phase II depicted in the R. W. Beck map are current activities for the special waste permit The remaining 251.46 acres of Phase II may have been present in past permits but is not present in the current permit. Any future expansion activity of the remaining area of Phase II will be applied for at that time.

1. Introduction

Big Rivers Electric Corporation (BREC) operated a special waste landfill in Ohio County, Kentucky. The special waste landfill was used for the disposal of fly ash, bottom ash and stabilized scrubber wastes. These wastes met the definition of “coal combustion by-products” given in 401 KAR 45:010 and “special waste” given in KRS 224.50-760(1) (a). These wastes are generated by the 440-megawatt D.B. Wilson Power Plant. The landfill is separated into two phases, Phase 1 and Phase 2. Both phases of the special waste landfill are situated on a reclaimed surface mine. It is the intention of BREC to close Phase 1 of the D.B. Wilson Station Special Waste Landfill with the submission of this Closure Plan.

The purpose of this Closure Plan is to meet the requirements given in 401 KAR 45:110. These regulations set certain criteria for the closure of a special waste landfill. This Closure Plan addresses these closure criteria performed by BREC to ensure no adverse effects occur to human health and the environment. The scope of the plan will include:

- Type and amount of waste in the facility;
- Mobility and expected rates of migration of the waste or leachate constituents;
- Site location, topography, surrounding land use and final use;
- Climate conditions in the area;
- Characteristics of the cover material and final cap design
- Geology and soil profiles and surface and subsurface hydrology of the site;
- Closure plan conformance.

2. CCR Waste

The bulk of the waste stream that was placed in Phase 1 of the landfill is known as Poz-o-tec. The D.B. Wilson Station is a scrubbed unit. Flue Gas Desulphurization (FGD) waste is removed as slurry which is then dewatered by vacuum filters to produce a wet filter cake. The filter cake is stabilized (fixed) by mixing the material with lime and fly ash. The unit has a limestone system which is enhanced with dibasic acid and sodium bisulfite. The end product is a material called Poz-o-tec, which can “set up” under the right conditions, similar to a lowgrade concrete.

The fixated material called Poz-o-tec was placed in the landfill. As the material was placed in the landfill it was spread and compacted in 18 to 36-inch layers. In areas that are unenhanced, material was placed in eight- foot lifts. This process insures the low permeability and high compressive strength.

Technical Information:

Moisture	15-30%
Permeability	1 x 10^{-5}cm/sec to 5 x 10^{-6}cm/sec
Unconfined Compressive Strength	2000 pounds per square foot
TCLP Tests	Attachment A
Engineering properties	Attachment B

2.3 Waste Estimates Amount (data unavailable prior to 2000)

Total Permit Boundary Area	700 acres	
Waste Disposal Area	103 acres	
Annual Quantities Generated	657,741 tons/yr.	544,60 cu.yds./yr.
	1,792 ton/day	1,492 cu.yds./day
Lifespan Estimate	17,101,300 tons	14,159,600 cu. /yds.

Phase 1 Special Waste Landfill Volume			
Year	**Jan. - June**	**July - Dec.**	**Yearly Total**
2000	257,855	292,541	**550,396**
2001	267,704	321,755	**589,458**
2002	290,193	222,311	**512,505**
2003	178,689	300,343	**479,032**
2004	285,747	278,882	**564,629**
2005	419,265	423,459	**842,724**
2006	539,830	539,063	**1,078,893**
2007	368,476	379,300	**747,776**
2008	357,234	356,269	**713,502**
2009	318,240	179,621	**497,861**
2010	311,925	346,448	**658,373**
Total Tons			**7,235,150.65**

Notes:

(1) The current Wilson Phase I Landfill (the Unit) footprint is approximately 103 acres. The Wilson Phase I Landfill began receiving waste approximately in 1984 and stopped receiving waste in approximately 2010. The Wilson Phase II Landfill is currently active.

3. Non CCR Waste

3.1 Waste Material

Phase 1 also contains a variety of non CCR contaminant sources. These materials include:

- Blasting grit;
- Cooling tower packing material;
- Asbestos containing material;
- Mill spray oil;
- Leachate;
- Oil impacted soil;
- Sediment from ponds and ditches, and;
- Construction and demolition debris.

3.2 Waste Characteristics

The characteristics, compositions, volumes, and locations of these materials were evaluated through review of landfill records obtained by open file requests under the Kentucky Open Records Act (KORA) program. A summary of the observations noted in the available files is provided in **D.B. Wilson 2020 Groundwater Assessment Plan.** Chemical analysis of various landfilled materials can be found in **Attachment A**. Overall, the file review observations indicate the following non-CCR wastes were disposed in the Unit:

- 5,605-cubic yards of spent sand-blasting grit:
  - Permitted for placement two to four times per month in 1992 and 1993.
  - No specific disposal location was mentioned.
  - The material is characterized as “Black Beauty” sand-blasting grit, which is a by-product of certain boiler systems. It was reported to have been used for cleaning of a clarifier, FGD system outlet ducts, and the barge unloader conveyor system, resulting in mixing with non-lead paint and coal tar epoxy.
- Cooling tower packing material (quantity records not located nor required at the time):
  - Location not specified.
  - Records only indicate that cooling tower packing material was one of the additional waste streams accepted by the facility.
  - This material consisted primarily of plastic trays.
- 5,005 barrels of asbestos-containing materials:
  - Placed between October 1990 and June 1993.
  - Most of the material was generated at BREC Coleman Station, but some was generated at Wilson.

- Mill spray oil (quantity records not located nor required at the time):
  - Location not specified.
  - Records only indicate that mill spray oil was one of the additional waste streams accepted by the facility. Anecdotally, mill spray oil is a mineral-based oil sprayed in the coal grinding mill to control dust.

- Leachate (quantity records not located nor required at the time):
  - Location not specified.
  - The character of leachate is presumably similar to that currently generated by the landfill.

- Sediment from Ponds and ditches (quantity records not located nor required at the time):
  - Various locations are possible, though pond and ditch sediment may not have been a significant waste stream during operation of Phase I.
  - The character of such sediments is likely to be dominated by that of the disposed material (ash and FGD materials) and cover soils.

- Miscellaneous construction debris (300 cubic yards/year was anticipated in the 1982 permit, but reportedly the material was only placed early in the plant history).
  - Generated and placed during plant construction.
  - Permitted to include “waste wood, metal, scraps, cardboard and similar materials”, but elsewhere described as “wood, metal scraps, brick (not chemically contaminated), and broken concrete”.

4. Background

4.1 Site Location

The site is located in western Ohio County, Kentucky. The landfill is north of Kentucky Route 85 and east of the Green River, which serves as the Ohio County – McLean County boundary. Phase 1 portion of the special waste landfill is a 103-acre area, which is part of the larger 700 acre permitted landfill. The location is depicted on the topographic map in Figure 1. The Phase I is the furthest eastern portion of the entire permitted landfill. As indicated in Figure 1, the vast majority of the landfill is situated on reclaimed surface mine.

4.2 Topography

The site lies in the Western Kentucky coalfields physiographic province. This area is characterized by extensive bottomlands and low hills. In the vicinity of the site, the natural topographic relief is on the order of 100 feet. The elevation in this area ranges from 310 to 410 feet above sea level. At the site, the natural topography has been considerably altered by surface mining and reclamation that occurred prior to the current special waste landfill. Prior to 1983, the site had been surfaced mined down to the No. 9 coal seam. Surface drainage at the site is to the south to an unnamed tributary to Elk Creek which drains to the west to the Green River.

4.3 Surrounding Land Use

The D.B. Wilson Landfill is located in a largely rural area of the county. This particular area is dominated by two types of land uses; agriculture and mining. According to 2009 U.S. Census data, 6.3% of establishments in Ohio County are agriculture or mining related. Based on the same data, 46 establishments in the county are agriculture and 33 establishments are mining. The average farm size is 166 acres. The types of farming include corn, soybean, wheat, tobacco, hay, and livestock farming. The area supports both underground and surface coal mining. Mining can contribute to sedimentation and acidic runoff to streams. Like the Wilson Landfill site, much of the area is dotted with reclaimed and un- reclaimed mine lands. The nearest urban area is the City of Island in McLean County west of the landfill, with a population 435 according U.S. Census data.

4.4 Climate

The climate in this area is temperate with moderately cold winters and warm humid summers. Temperatures in this area can range from 23°F to 91°F. This area has a relatively long period of frost- f r e e days, 175-200. Precipitation can range from 44-50 inch within a year. Soil temperatures in this area are considered Mesic. Mesic soil temperatures range from 46°F to 59°F. The table below summarizes climate data in the area of the Wilson Station Landfill. The tables depict temperature and precipitation data gather by NOAA at the Calhoun Lock 2. Calhoun is located approximately 10 miles northwest of the Wilson Landfill.

Climate Summary

Average annual temperature	57.1° F
Coldest month (average Temperature)	January (33.6° F)
Warmest month (average Temperature)	July (77.7° F)
Last freeze (average)	May 5th
First freeze (average)	October 3rd
Growing season (average)	188
Annual rainfall (average)	49.03 in.
Driest month (average rainfall)	October (3.14 in.)
Wettest month (average rainfall)	May (5.17 in.)

4.5 Final Site Use

Land use in the vicinity of the site is a mix of agricultural and mining. Corps planted in this area consists of corn, soybean & tobacco. According to the National Agricultural Statistics Service census, in 2007 Ohio County had 168,602 acres in farms. 62,713 were in harvested cropland. The area also supports a large number of poultry farms with around 150 chicken houses. The Phase 1 portion of the landfill is part of a multi-phase landfill, permitted for 700 acres located on previously surface mined land. The remainder of the permitted area remains as undeveloped reclaimed mine land. After the landfill is closed it is anticipated that Phase I will be maintained as a closed landfill. For the first five-year period after closure is completed, the facility will comply with the requirements of the post closure plan as approved by KDEP.

5. Characteristic of Cover Material

5.1 Cover Material

As groundwater corrective action for the D.B. Wilson Phase 1 CCR Landfill, an engineered synthetic turf cap with a geomembrane will be installed over the existing soil cover. This includes the removal of the current vegetation, installation of a geomembrane, and the placement of the synthetic turf with sand infill. In addition, the downspout pipes that are in place will be replaced with open channel flumes. Prior to geomembrane deployment, the cap surface will have the vegetation removed and be substantially smooth and substantially free of sharp objects and other deleterious material.

Mobility and rates of migration of the waste leachate constituents have placed the special waste landfill in groundwater assessment. Therefore, this cap has been selected as a form of groundwater corrective action to minimize infiltration and groundwater impact.

5.2 ClosureTurf®

ClosureTurf®, an alternative landfill closure system produced by Watershed Geosynthetics, Inc., and Agru America, Inc. is proposed for the D.B. Wilson Landfill closure. This material has been approved for use as an alternative cap in 13 states, with agency approval pending in several other states. Some of the installations have been in place since 2009. Several case studies are included in **Attachment F**. As outlined in the product overview information contained in **Attachment F**, the primary advantages of this product over a traditional composite capping system include:

- Improved quality of stormwater runoff and reduced long-term erosion issues.
  - Please note that the design drawings incorporate gravel drain ways and Hydro binder along the flow lines of the benches, flumes and perimeter ditches in order to minimize erosion of the sand infill. The extent of this is based on the projected “backwater” during peak flow during design storm events, as demonstrated by the hydrology evaluation, contained in **Attachment E.**

- Conservation of soil and topsoil, which is a vanishing commodity in many areas, particularly where strip mining has occurred
- Accelerated schedule (completing the closure within a year's time, rather than the 5 years previously contemplated).
- Carbon footprint reduction (significantly fewer truck trips required for cap construction)
- The future prospect of installing PowerCap™ solar panels on the landfill slopes, which has been successfully producing solar power at a site in Georgia for 18 months.
  - Due to erosional concerns, such an installation would make little sense on a traditional soil cap

The use of this product can also avoid the significant risk of geomembrane damage that could occur while placing a soil layer above it, particularly along the numerous benches. The primary driver for selecting the product at this strip-mined site is the lack of adequate soil in the quality and quantity necessary to complete a traditional soil cap. Importing native soil from an undisturbed borrow area would require a significant number of trucks to travel significant distance on the highway, posing an additional danger to the public.

The ClosureTurf® material has been tested for wind and rainfall erosion resistance, fire resistance, and aerodynamic uplift properties. Through testing at Georgia Tech, FIU, and elsewhere, the product has been assessed to withstand wind conditions at 118 mph with the test results also deducing that higher velocities actually produce less lift and require less infill material. Accelerated UV and tensile strength testing on the product has yielded a projected lifespan of over 100 years which exceeds the current post-closure regulatory period of 5 years specified in 401 KAR 45:110 Section 5.

Manufacturer data on the various testing, overview of the ClosureTurf® product, data regarding the projected lifespan of the product, and confirmation regarding the product's adherence to the closure cap criteria under Section 257.102(d) of the federal CCR Rule are provided in **Attachment F**. Although the CCR Rule does not apply to this inactive CCR landfill, it is an industry standard for the sake of comparison. The infiltration equivalency analysis contained in Attachment F shows that the projected infiltration through a ClosureTurf® is 3 to 43 times less than that of a traditional Subtitle D cap, depending on the method of calculation. This reduction in infiltration will significantly reduce the mobility and migration of leachate constituents. Groundwater levels at the site are below the CCR material, as indicated by various wells and piezometers installed around the unit.

5.3 Veneer Stability Analysis

Prior to installation of the cap, direct shear testing will be conducted to confirm the factor of safety against sliding for the following interfaces, in accordance with ASTM D 5321:

- Geomembrane vs Existing Soil Cover
- Engineered Synthetic Turf vs Geomembrane

The shear testing will be conducted prior to construction and compared to the veneer stability analysis (VSA) results to confirm an adequate factor of safety for the maximum credible earthquake. The VSA is based on site-specific data, a site response, and a deterministic hazard seismic analysis (DSHA). The VSA can be found in **Attachment G.** The DSHA can be found in **Attachment G1.**

6. Geology, Soil Profiles, & Site Hydrogeology

6.1 Physical Setting

The Phase I Landfill at Wilson Station is located on a ridge to the east of the Green River at an elevation of approximately 420 ft., amsl, with a maximum elevation of 520 ft. amsl. Precipitation falling on the Phase I Landfill is directed to ponds in the south and east sides of the unit and then to Elk Creek or the Rough River under Kentucky Pollution Discharge and Elimination System permit. Elk Creek is a primary tributary to the Green River, and it flows westward to the Green River.

6.2 Site Geology

Phase I lies in the Western Kentucky Coalfields section, characterized by rolling uplands underlain by coal-bearing bedrock of the Pennsylvanian Period. The geology underlying the landfill consists of unconsolidated materials, including loess, alluvial deposits and mine spoil, underlain by Upper to Middle Pennsylvanian-age clastic and carbonate bedrock consisting primarily of sandstone and shale.

The geologic quadrangle (Geologic map of the Equality quadrangle, Ohio County, Kentucky, 1969) for the Site vicinity published by the United States Geological Survey shows the surficial material to be unconsolidated Quaternary alluvium and Upper Pennsylvanian coal deposits, however, north of State Route 85 these materials were removed as part of historic strip-mining operations. Where present, the alluvium consists of silty clay and clayey silt, which ranges in thickness from 6 feet (MW-104) to 36 feet (MW-102). Within close proximity to the landfill, and north of State Route 85, mine spoils range in thickness from 33 feet (MW-1) to over 86 feet (MW-4D).

The unconsolidated materials are shown to be underlain by bedrock of the Middle Pennsylvanian Carbondale Formation. The Carbondale Formation consists of cyclic sequences of sandstones, shales, siltstones, and coals. The Carbondale sediments were deposited in a fluvial-deltaic system. As a result of this depositional environment, the sandstone units of the Carbondale tend to be lenticular bodies rather than continuous sheetlike strata. Gradational and abrupt horizontal changes in lithology are often encountered.

6.3 Hydrogeology

The unconsolidated mine spoil is considered to be the uppermost aquifer underlying the Landfill. The uppermost aquifer is unconfined and first encountered at an elevation of

approximately 400 ft., amsl at the north end of the Phase II Landfill and 395 ft. amsl at the south end. Flow direction beneath the Landfill is typically to the south and southeast. The mine spoil is bounded on the south (i.e., downgradient) by a headwall of undisturbed Carbondale Formation.

Slug tests were performed on April 23, 2019 at monitoring wells MW-4, MW-4D, and MW-10 to assess the hydraulic characteristics of the uppermost aquifer. The estimated hydraulic conductivity of the monitoring wells tested were 8.03 x10-2 centimeters per second (cm/sec) in MW-4, 9.30 x10-2 cm/sec in MW-4D, and 2.91 x10-2 cm/sec in MW-10. Hydraulic conductivity for the Carbondale Formation is estimated from literature, and for the purposes of this ACM, a range for sandstone of 1 x10-4 cm/sec to 1 x10-5 cm/sec is used. Groundwater flow downgradient of the mine spoil beneath the II Landfill is therefore rate-limited by the lower permeability in the Carbondale Formation.

The soil, geologic, and hydrogeologic conditions are provided in the different attachments.

See **Attachment C:** Geological Cross-sections and Groundwater Elevations.

6.4 Hydrology

The hydrologic evaluation for the landfill is found in **Attachment E**, and the flume, perimeter channel, and bench details can be found in **Attachment H.**

TABLES

Table 1. Selected Sites where ClosureTurf® has been Installed.

Select ClosureTurf® Installations				
Installation	**Type**	**Acres**	**State**	**Year**

								Half-life[9] (years)	277.41

Notes:

(1) UV Lamp On (hours per day) is given in Richgels (2015a, 2015b).
(2) Peak Turf Temps for New River, AZ given in Richgels (2015a, 2015b).
(3) Reaction Rate is calculated from the regression curve shown in Figure 4 for the upper bound (logarithmic) case.
(4) Lab half-life in hours is equal to 1/e^(Reaction Rate).
(5) Field equivalent (days) is calculated by dividing the lab half-life in hours by the UV lamp on hours per day.
(6) Field equivalent in days is converted to months using the given days in that particular month.
(7) Half-life loss per month is the inverse of the corresponding field equivalent in months.
(8) The yearly half-life loss is the sum of each individual months half-life loss.
(9) The half-life in years is the inverse of the yearly half-life loss.

Table 3. HDPE Grass Blade Lower Bound Half-Life Calculations (Geosyntec)

Month	UV Lamp On[(1)] (hours/day)	Months @ 80 C[(2)]	Months @ 70 C[(2)]	Months @ 60 C[(2)]	Peak Turf Temp[(3)] (C.)	Half-life Months (from Regression)	Half-life Loss per month

April	6.94	412	898	1834	40.58	3213	0.000311281
May	7.25	382	832	1698	51.21	2248	0.000444747
June	7.31	391	852	1740	61.52	1580	0.000633027
July	6.94	399	869	1775	66.82	1237	0.00080834
August	7.00	395	861	1759	64.80	1371	0.000729293
September	6.94	412	898	1834	59.43	1826	0.000547629
October	5.88	471	1026	2095	47.74	3070	0.000325779
November	4.56	627	1365	2788	36.38	5321	0.000187929
December	3.69	750	1635	3339	24.68	7945	0.000125871
Lab	20					**Yearly Half-life Loss**	0.00466405
						Half-life (years)	214.41

Notes:

(1) UV Lamp On (hours per day) is given in Richgels (2015a, 2015b).

(2) The months required at each temperature is calculated using the regressions from Figure 4 for each temperature, projected down to half-life, then dividing the lamp-hours at half-life by the UV lamp on hours per day for a given month. Once this calculation is done for 80, 70 and 60 C, a linear regression (as shown in Figure 5) is used to obtain the half-life months at the corresponding peak turf temp.

(3) Peak turf temperatures given in Richgels (2015a, 2015b).

FIGURES

Note: The sand ballast infill is not shown in the sample photo on the left, but is shown in a field application photo on the right.

APPLICATION TO ACCEPT AN ADDITIONAL WASTE STREAM

☐ NEW
☐ UPDA

(Prepare an individual application for each waste stream)

I. WASTE GENERATOR INFORMATION

A. GENERATOR IDENTIFICATION:

1. Name: Big Rivers Electric Corp. Wilson Station
2. Mailing Address: PO Box 24 42328
3. Address Where Waste Generated: PO Box 547 Rt 85 Centertown, KY.
4. Contact Person: Tom Shaw 5. Telephone: (502) 827-2561

B. WASTE DESCRIPTION:

1. Waste Name: Black Beauty Abrasive contaminated with Low lead base Paint
   Describe source of the waste including industrial process: Sandblasting steel to remove old paint
2. Is the waste hazardous under 401 KAR 31:010, Section 3, which includes the characteristics of 401 KAR 31:030 and the lists of 401 KAR 31:040? ☐ Yes ☒ No (If yes, contact your local Division of Waste Management Field Office for further assistance. See instructions for locations and telephone numbers.)
3. Is the waste an "exempt" hazardous waste under the regulatory cites in the Instructions?
   Regulatory Cite.
4. Waste Condition Upon Generation: ☒ Solid ☐ Semi-solid ☐ Liquid ☐ Other
5. Waste Treatment Description:
6. Disposal Site Name: Big Rivers Electric Corp D.B. Wilson Station 7. Permit # C92-04
8. Waste Condition Upon Disposal: ☒ Solid ☐ Semi-solid ☐ Liquid ☐ Other
9. Waste Amount: _____ 55-gal. drums or 1400 Cubic Yards (Note: 1 cubic yard = 202 gallons)
10. Frequency: ☐ Per Month ☒ Per Year ☐ One-Time Only

C. CONTAINER TYPE *(See Instructions)*:

☐ Paper bag ☐ Fiber drum or cardboard box ☐ Metal or plastic drum
☐ Plastic bag ☐ Double bagged in container ☐ Other *(specify)*
☒ Bulk ☐ Mixed with plant trash

D. FEE: Check payable to "KENTUCKY STATE TREASURER." *MAIL CHECK DIRECTLY TO SOLID WASTE BRANCH, DIVISION OF WASTE MANAGEMENT, 18 REILLY ROAD, FRANKFORT, KENTUCKY 40601)*

Check for $50.00 # 138484

E. SOLID WASTE GENERATOR CERTIFICATION:

I certify that the information set forth in Section I pertaining to the waste is true and correct and that the waste is not regulated as a hazardous waste under 401 KAR Chapter 31 which requires storage, treatment or disposal at a hazardous waste facility under 401 KAR Chapters 32 through 40. I understand that failure to properly manage a hazardous waste could lead to possible civil and criminal penalties under KRS Chapter 224 or the Resource Conservation and Recovery Act of 1976, (Public Law 94-5691, as amended.

Signature of Authorized Agent: Joe L. Craig Date: 6-05-91

Name of Authorized Agent (typed or printed): Joe L. Craig Title: Vice General Manager

of Environmental Aff.
Public, and Informati
Services

GENERATOR: Big Rivers Electric Corp Wilson Station PAGE 2

WASTE NAME: Black Beauty abrasive contaminated with (residual base) paint DATE: 6-14-91

II. LABORATORY INFORMATION

A. LABORATORY IDENTIFICATION:

1. Laboratory Name: N/A
2. Mailing Address: _____
3. Contact Person: _____ 4. Telephone: _____

B. SAMPLE COLLECTION:

1. Sampler Name: _____
2. Company: _____

C. SAMPLE CONTAINER:

1. Container Type: ☐ Glass ☐ Plastic ☐ Other (explain) _____
2. Sample Type: ☐ Composite ☐ Grab ☐ Other (explain) _____
3. Size of Container: _____
4. Preservative: _____

D. WASTE CHARACTERISTICS:

1. Does the waste exhibit the characteristic of a hazardous waste as described in 401 KAR 31:030:

CHARACTERISTICS	YES	NO	ANALYSIS
Ignitability	☐	☐	Flashpoint _____ °F
Corrosivity	☐	☐	pH _____
Reactivity	☐	☒	_____ mg/kg ☐ H_2S ☐ HCN
EP Toxicity	☐	☐	Contaminant(s) _____ _____ mg/l

2. Is the waste characteristically hazardous? ☐ Yes ☐ No
3. Waste passed paint filter test? ☒ Yes ☐ No 4. Solids Content 100 %

E. LABORATORY CERTIFICATION:

I certify the above results are true and correct and analyses were conducted in accordance with EPA publication SW-846 "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods."

Signature of Laboratory Analyst: _____ Date: _____

ATTACH LABORATORY RESULTS

F. MATERIAL SAFETY DATA SHEET:

1. Attached ☒ Yes ☐ No

III. TRANSPORTER INFORMATION

A. HAULER IDENTIFICATION:

1. Hauler Name: Big Rivers Electric Corp
2. Mailing Address: P.O. 24 Henderson KY
3. Contact Person: Tom Shaw 4. Telephone: (502) 827-2561

B. SECONDARY HAULER IDENTIFICATION:

1. Hauler Name: _____
2. Mailing Address: _____
3. Contact Person: _____ 4. Telephone: _____

GENERATOR: _____ PAGE 3 O

WASTE NAME: _____ DATE: _____

IV. LANDFILL INFORMATION

A. DISPOSAL SITE IDENTIFICATION:

1. Landfill Name: Big Rivers Electric Corp D.B. Wilson Permit #: 092-04
2. Mailing Address: P.O. Box
3. Contact Person: Tom Shaw 5. Telephone: (502) 827-2561

B. INSTRUCTIONS TO GENERATOR:

1. Time of Day Waste is to be Delivered: 7:30 to 5:00
2. Special handling requirements: material will be covered with poz-o-tec (Scrubber Sludge)
3. Comments: _____

C. DISPOSAL METHOD:

☐ Bury in container ☐ Co-mix with garbage ☐ Bury at bottom of lift ☐ Per EPA asbestos procedure

☒ Other Cover with poz-o-tec

D. LANDFILL CERTIFICATION:

I certify that I ☐ will not or ☑ if approved, will accept the waste described in Section I at the landfill named in Section IV.A. I propose to use the method of disposal described in Section IV. C. above. Failure to use the described, approved procedure may constitute illegal disposal. The waste to be received under this permit modification is compatible to the above mentioned landfill operation.

Signature of Authorized Agent for Landfill: _____ Date: 7-2-92

REED MINERALS

MATERIAL SAFETY DATA SHEET

(Complies with 29 CFR 1910.1200)

SECTION I - GENERAL

Reed Minerals
A Division of Harsco Corporation
8149 C Kennedy Avenue
Highland, IN 46322
Emergency Telephone Number:
(219) 923-4200

Product Name: Black Beauty®
Abrasives
CAS Number : 68476-96-0
Particulates not otherwise regulated.
Common Name : Boiler Slag
Date : April 15, 1987
Revised : August 1, 1988
2nd Revision: September 1, 1989

SECTION II - INGREDIENTS

	OSHA *PEL	ACGIH *TLV
Boiler Slag 100% (Typically as an amorphous mixture of Fe,Al,Ca silicates)		
Nuisance Dust		
Total Dust :	15	10
Respirable Dust :	5	5

*Values Expressed as mg/M^3

SECTION III - PHYSICAL DATA

Physical Form	: Solid (angular granules)
Boiling Temperature	: N/A
Melting Temperature	: greater than 2300°F
Vapor Pressure/Density	: N/A
Evaporation Rate	: N/A
Specific Gravity	: 2.7 g/cc (typical)
Water Solubility	: Negligible
Color	: Black
Odor	: None

SECTION IV - FIRE AND EXPLOSION DATA

Product is non-flammable and non-explosive.

SECTION V - REACTIVITY DATA

Product is stable under normal conditions of use, storage, and transportation.

Glass Med. 2

SECTION VI - HEALTH HAZARD DATA

Low health risk by inhalation. Treat as a nuisance dust. Typical free silica less than 0.1%. Human toxic response has not been demonstrated for any route of entry. Mechanical irritation may occur to eyes, skin, or respiratory tract. Pre-existing health conditions may be aggravated.

Carcinogenicity: NTP - No
IARC Monographs - No
OSHA Regulated - No

FIRST AID

In case of:

1. Eye contact - Immediately flush eyes thoroughly with water.

2. Skin contact - Wash skin with soap and water if irritation occurs.

3. Inhalation - Remove affected person(s) to fresh air source.

4. Oral Intake - Rinse mouth out with water.

If symptoms persist, contact a physician or other medical personnel.

SECTION VII - SPILL, LEAK, AND DISPOSAL PROCEDURES

No special procedures required for clean-up. Wetting with water will reduce airborne dust. Uncontaminated product does not exhibit characteristic EP Toxicity and may be disposed of as inert material in an appropriate solid waste landfill according to applicable Federal, State, and Local regulations.

SECTION VIII - CONTROL MEASURES

Use appropriate NIOSH certified respiratory protection when exposure limits may be exceeded. Maintain sufficient ventilation to allow visual contact with work surfaces. Appropriate abrasive blaster's protective equipment is required, which may also include gloves, hood with protective lens, safety glasses, and hearing protection.

SECTION IX - SPECIAL PRECAUTIONS

Keep product dry and free of all contamination to assure free flow. Use an appropriate safety screen over fill hatch of blasting pot. Respirable dusts may be generated during pressure abrasive cleaning operations.

- N O T E -

The opinions expressed herein are those of qualified experts within Harsco Corporation. Harsco believes that the information contained herein is current and accurate for the normal and intended use of this product as of the date of this Material Safety Data Sheet. Since the use of this information and of those opinions or the conditions of use of the product are not within the control of Harsco Corporation, it is the user's obligation to determine and observe the conditions of safe use and disposal of the product by their operations.

INTEROFFICE MEMO

October 31, 1991

TO: TOM SHAW

FROM: MIKE WELLS (MW)

SUBJECT: PAINT FILTER LIQUID TEST

A Paint Filter Liquid Test was performed according to EPA Method 9095 on the following sample with results as shown:

CL #	DESCRIPTION	RESULTS
16504	Wilson Barge Unloader Blasting Grit	Passed*

*Deemed to be free of liquids for purposes of 40 CFR 264.314 and 265.314. No material passed through filter during designated period.

GENERATOR: Big Rivers Electric Corp. PAGE 4 OF 5

WASTE NAME: Abrasive contaminated with paint DATE: 1/12/92

V. DIVISION OF WASTE MANAGEMENT FINAL DETERMINATION

A. GENERAL INFORMATION:

1. Landfill Name: Big Rivers Electric Corp. 2. County: Ohio

3. Landfill Permit #: 92-04 4. Expires: 6/30/92

B. APPROVAL:

The Division of Waste Management, Department for Environmental Protection, Natural Resources and Environmental Protection Cabinet, modifies the landfill permit cited in Section IVA of this application to allow disposal of the waste described herein. The Division reserves the right to modify or revoke this approval. This approval is invalid in the absence of a valid permit or if disposal is not in accordance with description herein or conditions described below.

Date: JAN 22 1992

George F. Gilbert, Jr.

George F. Gilbert, Jr., Manager
Solid Waste Branch
Division of Waste Management

C. DENIAL:

The Division of Waste Management, Department for Environmental Protection, Natural Resources and Environmental Protection Cabinet, rejects this application for the reason(s) stated below:

I. WASTE GENERATOR INFORMATION

A. GENERATOR IDENTIFICATION:

1. Name: Big Rivers Electric Corp D.B. Wilson Station this C
2. Mailing Address: P.O. Box 24 Henderson KY 4242 ATT. Tom Shaw
3. Address Where Waste Generated: P.O. Box 547 Centertown KY 42328
4. Contact Person: Tom Shaw 5. Telephone: 502 827-2561

B. WASTE DESCRIPTION:

1. Waste Name: Abrasive blasting grid contaminated with non lead-base paint.
   Describe source of the waste including industrial process: Abrasive blasting with Black Beauty grit the ~~elastif~~ clarifier
2. Is the waste hazardous under 401 KAR 31:010, Section 3, which includes the characteristics of 401 KAR 31:030 and the lists of 401 KAR 31:040? ☐ Yes ☒ No (If yes, contact your local Division of Waste Management Field Office for further assistance. See instructions for locations and telephone numbers.)
3. Is the waste an "exempt" hazardous waste under the regulatory cites in the Instructions? ☐ Yes ☒ No
   Regulatory Cite: _____

RECEIVED
JAN 10 1992
DIVISION OF WASTE MANAGEMENT
SOLID WASTE BRANCH

4. Waste Condition Upon Generation: ☒ Solid ☐ Semi-solid ☐ Liquid ☐ Other _____
5. Waste Treatment Description: None
6. Disposal Site Name: Big Rivers Electric Corp D.B. Wilson Station 7. Permit # 092.04
8. Waste Condition Upon Disposal: ☒ Solid ☐ Semi-solid ☐ Liquid ☐ Other _____
9. Waste Amount: _____ 55-gal. drums or 680 Cubic Yards (Note: 1 cubic yard = 202 gallons)
10. Frequency: ☐ Per Month ☒ Per Year ☐ One-Time Only

C. CONTAINER TYPE *(See Instructions)*:

☐ Paper bag _____ ☐ Fiber drum or cardboard box _____ ☐ Metal or plastic drum _____
☐ Plastic bag _____ ☐ Double bagged in container _____ ☐ Other *(specify)* _____
☒ Bulk _____ ☐ Mixed with plant trash _____

D. FEE: Check payable to "KENTUCKY STATE TREASURER." *(MAIL CHECK DIRECTLY TO SOLID WASTE BRANCH, DIVISION OF WASTE MANAGEMENT, 18 REILLY ROAD, FRANKFORT, KENTUCKY 40601)*

Check for $50.00 # 140032

E. SOLID WASTE GENERATOR CERTIFICATION:

I certify that the information set forth in Section I pertaining to the waste is true and correct and that the waste is not regulated as a hazardous waste under 401 KAR Chapter 31 which requires storage, treatment or disposal at a hazardous waste facility under 401 KAR Chapters 32 through 40. I understand that failure to properly manage a hazardous waste could lead to possible civil and criminal penalties under KRS Chapter 224 or the Resource Conservation and Recovery Act of 1976, (Public Law 94-580), as amended.

Signature of Authorized Agent: Joe L Craig Date: 7/29/91

Name of Authorized Agent *(typed or printed)*: Joe L. Craig Title: Vice General Manager of Fuels, Environment Affairs, and Informat Systems

II. LABORATORY INFORMATION ATTACH

A. LABORATORY IDENTIFICATION:

1. Laboratory Name: _____
2. Mailing Address: _____
3. Contact Person: _____ 4. Telephone: _____

B. SAMPLE COLLECTION:

1. Sampler Name: _____
2. Company: _____

C. SAMPLE CONTAINER:

1. Container Type: ☐ Glass ☐ Plastic ☐ Other (explain) _____
2. Sample Type: ☐ Composite ☐ Grab ☐ Other (explain) _____
3. Size ofContainer: _____
4. Preservative: _____

D. WASTE CHARACTERISTICS:

1. Does the waste exhibit the characteristic of a hazardous waste as described in 401 KAR 31:030.

CHARACTERISTICS	YES	NO	ANALYSIS
Ignitability	☐	☐	Flashpoint _____ °F
Corrosivity	☐	☐	pH _____
Reactivity	☐	☐	_____ mg/kg ☐ H_2S ☐ HCN
EP Toxicity	☐	☐	Contaminant(s) _____ mg/l

2. Is the waste characteristically hazardous? ☐ Yes ☐ No
3. Waste passed paint filter test? ☐ Yes ☐ No 4. Solids Content _____

E. LABORATORY CERTIFICATION:

I certify the above results are true and correct and analyses were conducted in accordance with EPA publication SW-846 "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods."

Signature of Laboratory Analyst: _____ Date: _____

WASTE NAME: Abrasive blasting grit contaminated with lead-base paint DATE: 7-29-91

IV. LANDFILL INFORMATION

A. DISPOSAL SITE IDENTIFICATION:

1. Landfill Name: Big Rivers Electric Corp D.B. Wilson 2. Permit #: 0204
3. Mailing Address: PO Box 517 Centertown KY 42328 Att. Tom Shaw
4. Contact Person: Tom Shaw 5. Telephone:

B. INSTRUCTIONS TO GENERATOR:

1. Time of Day Waste is to be Delivered: 7:30 a.m. to 3:30 p.m.
2. Special handling requirements: Cover with poz-o-tec.

3. Comments:

C. DISPOSAL METHOD:

☐ Bury in container ☐ Co-mix with garbage ☑ Bury at bottom of lift ☐ Per EPA asbestos procedure

☐ Other

D. LANDFILL CERTIFICATION:

I certify that I ☐ will not or ☐ if approved, will accept the waste described in Section I at the landfill named in Section IV.A. I propose to use the methods of disposal described in Section IV. C. above. Failure to use the described, approved procedure may constitute illegal disposal. The waste to be received under this permit modification is compatible to the above mentioned landfill operation.

THIS REPORT HAS BEEN PRINTED ON RECYCLED PAPER FOR YOUR PROTECTION

REED MINERALS

MATERIAL SAFETY DATA SHEET

(Complies with 29 CFR 1910.1200)

SECTION I - GENERAL

Reed Minerals
A Division of Harsco Corporation
8149 C Kennedy Avenue
Highland, IN 46322
Emergency Telephone Number:
(219) 923-4200

Product Name: Black Beauty®
Abrasives
CAS Number : 68476-86-8
Particulates not
otherwise regulated.
Common Name : Boiler Slag
Date : April 15, 1987
Revised : August 1, 1988
2nd Revision: September 1, 1989

SECTION II - INGREDIENTS

		OSHA *PEL	ACGIH *TLV
Boiler Slag 100% (Typically as an amorphous mixture of Fe,Al,Ca silicates)	Nuisance Dust		
	Total Dust :	15	10
	Respirable Dust :	5	5

*Values Expressed as mg/M^3

SECTION III - PHYSICAL DATA

Physical Form	:	Solid (angular granules)
Boiling Temperature	:	N/A
Melting Temperature	:	greater than 2300°F
Vapor Pressure/Density	:	N/A
Evaporation Rate	:	N/A
Specific Gravity	:	2.7 g/cc (typical)
Water Solubility	:	Negligible
Color	:	Black
Odor	:	None

SECTION IV - FIRE AND EXPLOSION DATA

Product is non-flammable and non-explosive.

SECTION V - REACTIVITY DATA

Product is stable under normal conditions of use, storage, and transportation.

Blast Medium

SECTION VI - HEALTH HAZARD DATA

Low health risk by inhalation. Treat as a nuisance dust. Typical free silica less than 0.1%. Human toxic response has not been demonstrated for any route of entry. Mechanical irritation may occur to eyes, skin, or respiratory tract. Pre-existing health conditions may be aggravated.

Carcinogenicity: NTP - No
IARC Monographs - No
OSHA Regulated - No

FIRST AID

In case of:

1. Eye contact - immediately flush eyes thoroughly with water.
2. Skin contact - Wash skin with soap and water if irritation occurs.
3. Inhalation - Remove affected person(s) to fresh air source.
4. Oral Intake - Rinse mouth out with water.

If symptoms persist, contact a physician or other medical personnel.

SECTION VII - SPILL, LEAK, AND DISPOSAL PROCEDURES

No special procedures required for clean-up. Wetting with water will reduce airborne dust. Uncontaminated product does not exhibit characteristic EP Toxicity and may be disposed of as inert material in an appropriate solid waste landfill according to applicable Federal, State, and Local regulations.

SECTION VIII - CONTROL MEASURES

Use appropriate NIOSH certified respiratory protection when exposure limits may be exceeded. Maintain sufficient ventilation to allow visual contact with work surfaces. Appropriate abrasive blaster's protective equipment is required, which may also include gloves, hood with protective lens, safety glasses, and hearing protection.

SECTION IX - SPECIAL PRECAUTIONS

Keep product dry and free of all contamination to assure free flow. Use an appropriate safety screen over fill hatch of blasting pot. Respirable dusts may be generated during pressure abrasive cleaning operations.

- N O T E -

The opinions expressed herein are those of qualified experts within Harsco Corporation. Harsco believes that the information contained herein is current and accurate for the normal and intended use of this product as of the date of this Material Safety Data Sheet. Since the use of this information and of these opinions or the conditions of use of the product are not within the control of Harsco Corporation, it is the user's obligation to determine and observe the conditions of safe use and disposal of the product by their operations.

INTEROFFICE MEMO

October 31, 1991

TO: TOM SHAW

FROM: MIKE WELLS mw

SUBJECT: PAINT FILTER LIQUID TEST

A Paint Filter Liquid Test was performed according to EPA Method 9095 on the following sample with results as shown:

CL #	DESCRIPTION	RESULTS
16503	Wilson #1 Clarifier Blasting Grit	Passed*

*Deemed to be free of liquids for purposes of 40 CFR 264.314 and 265.314. No material passed through filter during designated period.

WASTE NAME: Grease Coal Combustion Waste DATE: 1/13/92

V. DIVISION OF WASTE MANAGEMENT FINAL DETERMINATION

A. GENERAL INFORMATION:

1. Landfill Name: Big Rivers Electric Corp. 2. County: Ohio

3. Landfill Permit #: 92-04 4. Expires: 6/30/92

B. APPROVAL:

The Division of Waste Management, Department for Environmental Protection, Natural Resources and Environmental Protection Cabinet, modifies the landfill permit cited in Section IVA of this application to allow disposal of the waste described herein. The Division reserves the right to modify or revoke this approval. This approval is invalid in the absence of a valid permit or if disposal is not in accordance with description herein or conditions described below.

Date: JAN 22 1992

George F. Gilbert Jr.

George F. Gilbert, Jr., Manager
Solid Waste Branch
Division of Waste Management

C. DENIAL:

The Division of Waste Management, Department for Environmental Protection, Natural Resources and Environmental Protection Cabinet, rejects this application for the reason(s) stated below.

I. WASTE GENERATOR INFORMATION

A. GENERATOR IDENTIFICATION:

1. Name: Big Rivers Electric Corp D. B. Wilson
2. Mailing Address: P.O. Box 24 Henderson KY 42420
3. Address Where Waste Generated: P.O. Box 547 ~~Sebree~~ Centertown KY 42328 ATT Tom Shaw
4. Contact Person: Tom Shaw 5. Telephone: _____

B. WASTE DESCRIPTION:

1. Waste Name: Abrasive blasting contaminated with coal tar ~~epoxy~~ Epoxy

   Describe source of the waste including industrial process: Abrasive blasting with Black Beauty the FGD system outlet duct to remove coal tar epoxy from the steel.

2. Is the waste hazardous under 401 KAR 31:010, Section 3, which includes the characteristics of 401 KAR 31:030 and the lists of 401 KAR 31:040? ☐ Yes ☐ No (If yes, contact your local Division of Waste Management Field Office for further assistance. See instructions for locations and telephone numbers.)
3. Is the waste an "exempt" hazardous waste under the regulatory cites in the Instructions?

   Regulatory Cite: _____

RECEIVED
JAN 10 1992
DIVISION OF WASTE MANAGEMENT
SOLID WASTE BRANCH

4. Waste Condition Upon Generation: ☑ Solid ☐ Semi-solid ☐ Liquid ☐ Other _____
5. Waste Treatment Description: _____
6. Disposal Site Name: Big Rivers Electric Corp D.B. Wilson Station Permit # 092.04
8. Waste Condition Upon Disposal: ☒ Solid ☐ Semi-solid ☐ Liquid ☐ Other _____
9. Waste Amount: _____ 55-gal. drums or 25 Cubic Yards (Note: 1 cubic yard = 202 gallons)
10. Frequency: ☐ Per Month ☒ Per Year ☐ One-Time Only

C. CONTAINER TYPE *(See Instructions)*:

☐ Paper bag _____ ☐ Fiber drum or cardboard box _____ ☐ Metal or plastic drum _____
☐ Plastic bag _____ ☐ Double bagged in container _____ ☐ Other *(specify)* _____
☒ Bulk _____ ☐ Mixed with plant trash _____

D. FEE: Check payable to "KENTUCKY STATE TREASURER." *(MAIL CHECK DIRECTLY TO SOLID WASTE BRANCH, DIVISION OF WASTE MANAGEMENT, 18 REILLY ROAD, FRANKFORT, KENTUCKY 40601)*

Check for $50.00 # 140032

E. SOLID WASTE GENERATOR CERTIFICATION:

I certify that the information set forth in Section I pertaining to the waste is true and correct and that the waste is not regulated as a hazardous waste under 401 KAR Chapter 31 which requires storage, treatment or disposal at a hazardous waste facility under 401 KAR Chapters 32 through 40. I understand that failure to properly manage a hazardous waste could lead to possible civil and criminal penalties under KRS Chapter 224 or the Resource Conservation and Recovery Act of 1976, (Public Law 94-580), as amended.

Signature of Authorized Agent: Joe L. Craig Date: 7/24/91

WASTE NAME: Abrasive blasting contaminated with coal tar Epoxy DATE: 6-14-91

IV. LANDFILL INFORMATION

A. DISPOSAL SITE IDENTIFICATION:

1. Landfill Name: Big Rivers Electric Corp. - D.B. Wilson 2. Permit #: 0902-04
3. Mailing Address: P.O. Box 543 Centertown KY 42328 AT: Tom Shaw
4. Contact Person: Tom Shaw 5. Telephone:

B. INSTRUCTIONS TO GENERATOR:

1. Time of Day Waste is to be Delivered: 7:30 to 3:30 pm
2. Special handling requirements: Cover with poz-o-tec

3. Comments:

C. DISPOSAL METHOD:

☐ Bury in container ☐ Co-mix with garbage ☑ Bury at bottom of lift ☐ Per EPA asbestos procedure

☐ Other

D. LANDFILL CERTIFICATION:

I certify that I [☐] will not or [☐] if approved, will accept the waste described in Section I at the landfill named in Section IV.A. I propose to use the method of disposal described in Section IV. C. above. Failure to use the described, approved procedure may constitute illegal disposal. The waste to be received under this permit modification is compatible to the above mentioned landfill operation.

MATERIAL SAFETY DATA SHEET

NFPA 1-82

FOR COATINGS, RESINS AND RELATED MATERIALS

7001
7005

(Approved by U.S. Department of Labor, Essentially Similar to Form OSHA 20)

Section I

MANUFACTURER'S NAME: PORTER PAINT CO.

DATE OF PREP: 11/16/84

STREET ADDRESS: 400 South 13th Street

CITY, STATE AND ZIP CODE: Louisville, KY 40201

EMERGENCY TELEPHONE NO: (502) 588-9259

INFORMATION TELEPHONE NO: (502) 586-9290

PRODUCT CLASS: Coal Tar Epoxy

MANUFACTURER'S CODE IDENTIFICATION

TRADE NAME

7001 Tarset Standard (Part A)
7005 Tarset Catalyst (Part B)

Section II—HAZARDOUS INGREDIENTS

INGREDIENT	PERCENT A	PERCENT B	PERCENT A+B	OCCUPATIONAL EXPOSURE LIMITS (TLV)	VAPOR PRESSURE (@ 20°C)	TOXICITY DATA
Coal Tar Pitch Volatiles (benzene solubles), CAS #8007-45-2	<1		<1	0.2 mg/m³		skin, inhala
Hi Flash Naphtha		30	<1	200 ppm	<3.0	
Xylene, CAS #1330-20-7	<5		<5	100 ppm	5.1	
Coal Tar Naphtha, CAS #MX8030-31-7	15		15	100 ppm *		
Diethylenetriamine, CAS #111-40-0		65	2	1 ppm		skin, pulmor sensitizer
Benzene, CAS #71-43-2	<0.1	**by volume		10 ppm		
	* Indene present, TLV of			10 ppm		≤ 45 mg/m³

Section III—PHYSICAL DATA

BOILING RANGE: 282-374°F

VAPOR DENSITY: ☒ HEAVIER ☐ LIGHTER THAN AIR

EVAPORATION RATE: ☐ FASTER ☒ SLOWER THAN ETHER

PERCENT VOLATILE BY VOLUME: A=30 B=37 A+B=30

WEIGHT PER GALLON: A=11.0 lbs. B=7.7 lbs. A+B=10.6 lbs.

Section IV—FIRE AND EXPLOSION HAZARD DATA

FLAMMABILITY CLASSIFICATION: Combustible Liquid, OSHA Class II; DOT Combustible

FLASH POINT: A=103°F B=115°F A+B=101°F

LEL 0.7

EXTINGUISHING MEDIA

☒ FOAM ☐ ALCOHOL FOAM ☒ CO_2 ☒ DRY CHEMICAL ☐ WATER FOG ☐ OTHER

UNUSUAL FIRE AND EXPLOSION HAZARDS

Keep containers tightly closed. Isolate from heat, sparks, electrical equipment, and open flame. Closed containers may explode when exposed to extreme heat. In absence of electricity water spray (fog nozzle preferred) may be used to cool containers. Avoid exposure to decomposition products. Wear self-contained breathing equipment.

Section V—HEALTH HAZARD DATA

HEALTH HAZARDS (ACUTE AND CHRONIC)

Inhalation: Irritation of the respiratory tract or acute nervous system causing headache,dizziness, nausea.

Acute: Eye and Skin: Primary irritation. Photo sensitization may occur.

Chronic: Prolonged or repeated exposures may lead to dermatitis, skin cancer. DETA has potential to be a pulmonary sensitizer.

EMERGENCY AND FIRST AID PROCEDURES

Vapors: Remove from exposure. Restore breathing. Keep warm and quiet. Notify physician.

Splash (Eyes): Flush immediately with large amounts of water for at least 15 minutes. Take to physician for medical treatment.

Splash (Skin): Wash affected areas with water. Remove contaminated clothing.

Section VI—REACTIVITY DATA

STABILITY (UNSTABLE, STABLE) STABLE CONDITIONS TO AVOID

INCOMPATABILITY (MATERIALS TO AVOID)

HAZARDOUS DECOMPOSITION PRODUCTS

May produce hazardous fumes when heated to decomposition as in welding. Fumes may contain CO

HAZARDOUS POLYMERIZATION (MAY OCCUR, WILL NOT OCCUR) WILL NOT OCCUR

Section VII—SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED

Remove all sources of ignition (flames, hot surfaces, and electrical, static or friction sparks). Avoid breathing vapors. Ventilate area. Remove with inert absorbent and use non-sparking tools.

WASTE DISPOSAL METHOD: Dispose of in a safe manner in accordance with local, state, and federal regulations. Do not incinerate closed containers.

Section VIII—SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION In outdoor or open areas with unrestricted ventilation, use NIOSS/MSHA-approved filter respirator to remove solid airborne particles of overspray during spray application. In restricted ventilation areas use approved mechanical filter respirators designed to remove particulates, gas and vapor. In confined areas, use approved air line type respirators and hood. VENTILATION: Provide general dilution or local exhaust ventilation in volume and pattern to keep the TLV's and the LEL below the stated limits and to remove decomposition products during welding or flame cutting of surfaces coated with this product.

PROTECTIVE GLOVES Required for prolonged or repeated contact.

EYE PROTECTION Must use safety eyewear with splash guards or side shields.

OTHER PROTECTIVE EQUIPMENT Remove and wash contaminated clothing.

Section IX—SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING Secure closures and keep containers upright to prevent leakage. Store large quantities only in buildings designed to comply with OSHA 1910.106. Other Precautions:Do not store above 120°F. Do not take internally. Before smoking or eating, clean hands thoroughly. Do not get on skin or in eyes. Avoid breathing vapors or spray mist. Avoid storing or using near heat, sparks, or flame. Containers should be grounded when pouring. Avoid free fall of liquid in excess of a few inches. Do not flame cut, braze or weld without approved respirator or appropriate ventilation. All electrical equipment and installations should be made and grounded in accordance with the National Electrical Code. Workmen should be required to use only non-ferrous tools and wear non-sparking and conductive shoes in areas where explosion hazards exist.

REED MINERALS

MATERIAL SAFETY DATA SHEET

(Complies with 29 CFR 1910.1200)

SECTION I - GENERAL

Reed Minerals
A Division of Harsco Corporation
8145 C Kennedy Avenue
Highland, IN 46322
Emergency Telephone Number:
(219) 923-4200

Product Name: Black Beauty®
Abrasives
CAS Number : 68476-86-8
Particulates not
otherwise regulated.
Common Name : Boiler Slag
Date : April 15, 1987
Revised : August 1, 1988
2nd Revision: September 1, 1989

SECTION II - INGREDIENTS

		OSHA *PEL	ACGIH *TLV
Boiler Slag 100% (Typically as an amorphous mixture of Fe,Al,Ca silicates)	Nuisance Dust		
	Total Dust :	15	10
	Respirable Dust :	5	5

*Values Expressed as mg/M^3

SECTION III - PHYSICAL DATA

Physical Form	:	Solid (angular granules)
Boiling Temperature	:	N/A
Melting Temperature	:	greater than 2300°F
Vapor Pressure/Density	:	N/A
Evaporation Rate	:	N/A
Specific Gravity	:	2.7 g/cc (typical)
Water Solubility	:	Negligible
Color	:	Black
Odor	:	None

SECTION IV - FIRE AND EXPLOSION DATA

Product is non-flammable and non-explosive.

SECTION V - REACTIVITY DATA

Product is stable under normal conditions of use, storage, and transportation.

Glass Medial

SECTION VI - HEALTH HAZARD DATA

Low health risk by inhalation. Treat as a nuisance dust. Typical free silica less than 0.1%. Human toxic response has not been demonstrated for any route of entry. Mechanical irritation may occur to eyes, skin, or respiratory tract. Pre-existing health conditions may be aggravated.

Carcinogenicity: NTP - No
IARC Monographs - No
OSHA Regulated - No

FIRST AID

In case of:

1. Eye contact - Immediately flush eyes thoroughly with water.
2. Skin contact - Wash skin with soap and water if irritation occurs.
3. Inhalation - Remove affected person(s) to fresh air source.
4. Oral intake - Rinse mouth out with water.

If symptoms persist, contact a physician or other medical personnel.

SECTION VII - SPILL, LEAK, AND DISPOSAL PROCEDURES

No special procedures required for clean-up. Wetting with water will reduce airborne dust. Uncontaminated product does not exhibit characteristic EP Toxicity and may be disposed of as inert material in an appropriate solid waste landfill according to applicable Federal, State, and Local regulations.

SECTION VIII - CONTROL MEASURES

Use appropriate NIOSH certified respiratory protection when exposure limits may be exceeded. Maintain sufficient ventilation to allow visual contact with work surfaces. Appropriate abrasive blaster's protective equipment is required, which may also include gloves, head with protective lens, safety glasses, and hearing protection.

SECTION IX - SPECIAL PRECAUTIONS

Keep product dry and free of all contamination to assure free flow. Use an appropriate safety screen over fill hatch of blasting pot. Respirable dusts may be generated during pressure abrasive cleaning operations.

- N O T E -

The opinions expressed herein are those of qualified experts within Harsco Corporation. Harsco believes that the information contained herein is current and accurate for the normal and intended use of this product as of the date of this Material Safety Data Sheet. Since the use of this information and of those opinions or the conditions of use of the product are not within the control of Harsco Corporation, it is the user's obligation to determine and observe the conditions of safe use and disposal of the product by their operations.

INTEROFFICE MEMO

October 31, 1991

TO: TOM SHAW

FROM: MIKE WELLS

SUBJECT: PAINT FILTER LIQUID TEST

A Paint Filter Liquid Test was performed according to EPA Method 9095 on the following sample with results as shown:

CL #	DESCRIPTION	RESULTS
16502	Wilson FGD Blasting Grit	Passed*

*Deemed to be free of liquids for purposes of 40 CFR 264.314 and 265.314. No material passed through filter during designated period.

V. DIVISION OF WASTE MANAGEMENT FINAL DETERMINATION

A. GENERAL INFORMATION:

1. Landfill Name: Big Rivers Electric Corp. 2. County Ohio

3. Landfill Permit #: 92 04 4. Expires: 6/30/92

B. APPROVAL:

The Division of Waste Management, Department for Environmental Protection, Natural Resources and Environmental Protection Cabinet, modifies the landfill permit cited in Section IVA of this application to allow disposal of the waste described herein. The Division reserves the right to modify or revoke this approval. This approval is invalid in the absence of a valid permit or if disposal is not in accordance with description herein or conditions described below.

Date: JAN 22 1992

George F. Gilbert, Jr.

George F. Gilbert, Jr., Manager
Solid Waste Branch
Division of Waste Management

C. DENIAL:

The Division of Waste Management, Department for Environmental Protection, Natural Resources and Environmental Protection Cabinet, rejects this application for the reason(s) stated below:

Date: _____

George F. Gilbert, Jr., Manager
Solid Waste Branch
Division of Waste Management

I. WASTE GENERATOR INFORMATION

A. GENERATOR IDENTIFICATION:

1. Name: Big Rivers Electric Corp. Wilson Station
2. Mailing Address: P.O. Box 24 42328
3. Address Where Waste Generated: P.O. Box 547 Rt 85 Centertown, KY.
4. Contact Person: Tom Shaw 5. Telephone: (502) 827-2561

B. WASTE DESCRIPTION:

1. Waste Name: Black Beauty Abrasive contaminated with (non lead base) Paint

   Describe source of the waste including industrial process: Sandblasting steel to remove old paint

2. Is the waste hazardous under 401 KAR 31:010, Section 3, which includes the characteristics of 401 KAR 31:030 and the lists of 401 KAR 31:040? ☐ Yes ☒ No (If yes, contact your local Division of Waste Management Field Office for further assistance. See instructions for locations and telephone numbers.)
3. Is the waste an "exempt" hazardous waste under the regulatory cites in the Instructions? ☐ Yes ☐ No

   Regulatory Cite:

RECEIVED
JAN 10 1992
DIVISION OF WASTE MANAGEMENT
SOLID WASTE BRANCH

4. Waste Condition Upon Generation: ☒ Solid ☐ Semi-solid ☐ Liquid ☐ Other
5. Waste Treatment Description:

Ohio

6. Disposal Site Name: Big Rivers Electric Corp D. B. Wilson Station 7. Permit # 092.04
8. Waste Condition Upon Disposal: ☒ Solid ☐ Semi-solid ☐ Liquid ☐ Other
9. Waste Amount: _____ 55-gal. drums or 1900 Cubic Yards (Note: 1 cubic yard = 202 gallons)
10. Frequency: ☐ Per Month ☒ Per Year ☐ One-Time Only

C. CONTAINER TYPE *(See Instructions)*:

☐ Paper bag _____ ☐ Fiber drum or cardboard box _____ ☐ Metal or plastic drum _____
☐ Plastic bag _____ ☐ Double bagged in container _____ ☐ Other *(specify)* _____
☒ Bulk _____ ☐ Mixed with plant trash _____

D. FEE: Check payable to "KENTUCKY STATE TREASURER." *(MAIL CHECK DIRECTLY TO SOLID WASTE BRANCH, DIVISION OF WASTE MANAGEMENT, 18 REILLY ROAD, FRANKFORT, KENTUCKY 40601)*

Check for $50.00 # 138484

E. SOLID WASTE GENERATOR CERTIFICATION:

I certify that the information set forth in Section I pertaining to the waste is true and correct and that the waste is not regulated as a hazardous waste under 401 KAR Chapter 31 which requires storage, treatment or disposal at a hazardous waste facility under 401 KAR Chapters 32 through 40. I understand that failure to properly manage a hazardous waste could lead to possible civil and criminal penalties under KRS Chapter 224 or the Resource Conservation and Recovery Act of 1976, (Public Law 94-580), as amended.

Signature of Authorized Agent: X Joe L. Craig Date: 6-18-91

II. LABORATORY INFORMATION

A. LABORATORY IDENTIFICATION:

1. Laboratory Name: N/A
2. Mailing Address: _____
3. Contact Person: _____ 4. Telephone: _____

B. SAMPLE COLLECTION:

1. Sampler Name: _____
2. Company: _____

C. SAMPLE CONTAINER:

1. Container Type: ☐ Glass ☐ Plastic ☐ Other (explain) _____
2. Sample Type: ☐ Composite ☐ Grab ☐ Other (explain) _____
3. Size of Container: _____
4. Preservative: _____

D. WASTE CHARACTERISTICS:

1. Does the waste exhibit the characteristic of a hazardous waste as described in 401 KAR 31:030.

CHARACTERISTICS	YES	NO	ANALYSIS
Ignitability	☐	☐	Flashpoint _____ °F
Corrosivity	☐	☐	pH _____
Reactivity	☐	☐	_____ mg/kg ☐ H_2S ☐ HCN
EP Toxicity	☐	☐	Contaminant(s) _____ mg/l

2. Is the waste characteristically hazardous? ☐ Yes ☐ No
3. Waste passed paint filter test? ☒ Yes ☐ No 4. Solids Content: 100 %

E. LABORATORY CERTIFICATION:

I certify the above results are true and correct and analyses were conducted in accordance with EPA publication SW-846 "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods."

Signature of Laboratory Analyst: _____ Date: _____

IV. LANDFILL INFORMATION

A. DISPOSAL SITE IDENTIFICATION:

1. Landfill Name: Big Rivers Electric Corp D.B. Wilson 2. Permit # 092-04

3. Mailing Address: P.O. Box

4. Contact Person: Tom Shaw 5. Telephone: (502) 827-2561

B. INSTRUCTIONS TO GENERATOR:

1. Time of Day Waste is to be Delivered: 7:30 to 5:00

2. Special handling requirements: Material will be covered with pozz-o-tec (Scrubber Sludge)

3. Comments:

C. DISPOSAL METHOD:

☐ Bury in container ☐ Co-mix with garbage ☐ Bury at bottom of lift ☐ Per EPA asbestos procedure

☒ Other Cover with pozz-o-tec

D) LANDFILL CERTIFICATION:

I certify that I [ ] will not or [X] if approved, will accept the waste described in Section I at the landfill named in Section IV.A. I propose to use the method of disposal described in Section IV. C. above. Failure to use the described, approved procedure may constitute illegal disposal. The waste to be received under this permit modification is compatible to the above mentioned landfill operation.

Black Mount

REED MINERALS

MATERIAL SAFETY DATA SHEET

(Complies with 29 CFR 1910.1200)

SECTION I - GENERAL

Reed Minerals
A Division of Harsco Corporation
8145 C Kennedy Avenue
Highland, IN 46322
Emergency Telephone Number:
(219) 923-4200

Product Name: Black Beauty®
Abrasives
CAS Number : 68476-86-0
Particulates not
otherwise regulated.
Common Name : Boiler Slag
Date : April 15, 1987
Revised : August 1, 1988
2nd Revision: September 1, 1989

SECTION II - INGREDIENTS

	OSHA *PEL	ACGIH *TLV
Boiler Slag 100% (Typically as an amorphous mixture of Fe,Al,Ca silicates)		
Nuisance Dust		
Total Dust :	15	10
Respirable Dust :	5	5

*Values Expressed as mg/M^3

SECTION III - PHYSICAL DATA

Physical Form	: Solid (angular granules)
Boiling Temperature	: N/A
Melting Temperature	: greater than 2300°F
Vapor Pressure/Density	: N/A
Evaporation Rate	: N/A
Specific Gravity	: 2.7 g/cc (typical)
Water Solubility	: Negligible
Color	: Black
Odor	: None

SECTION IV - FIRE AND EXPLOSION DATA

Product is non-flammable and non-explosive.

SECTION V - REACTIVITY DATA

Product is stable under normal conditions of use, storage, and transportation.

Glass Bead
Abr. Media

SECTION VI - HEALTH HAZARD DATA

Low health risk by inhalation. Treat as a nuisance dust. Typical free silica less than 0.1%. Human toxic response has not been demonstrated for any route of entry. Mechanical irritation may occur to eyes, skin, or respiratory tract. Pre-existing health conditions may be aggravated.

Carcinogenicity: NTP - No
IARC Monographs - No
OSHA Regulated - No

FIRST AID

In case of:

1. Eye contact - Immediately flush eyes thoroughly with water.
2. Skin contact - Wash skin with soap and water if irritation occurs.
3. Inhalation - Remove affected person(s) to fresh air source.
4. Oral Intake - Rinse mouth out with water.

If symptoms persist, contact a physician or other medical personnel.

SECTION VII - SPILL, LEAK, AND DISPOSAL PROCEDURES

No special procedures required for clean-up. Wetting with water will reduce airborne dust. Uncontaminated product does not exhibit characteristic EP Toxicity and may be disposed of as inert material in an appropriate solid waste landfill according to applicable Federal, State, and Local regulations.

SECTION VIII - CONTROL MEASURES

Use appropriate NIOSH certified respiratory protection when exposure limits may be exceeded. Maintain sufficient ventilation to allow visual contact with work surfaces. Appropriate abrasive blaster's protective equipment is required, which may also include gloves, hood with protective lens, safety glasses, and hearing protection.

SECTION IX - SPECIAL PRECAUTIONS

Keep product dry and free of all contamination to assure free flow. Use an appropriate safety screen over fill hatch of blasting pot. Respirable dusts may be generated during pressure abrasive cleaning operations.

- N O T E -

The opinions expressed herein are those of qualified experts within Harsco Corporation. Harsco believes that the information contained herein is current and accurate for the normal and intended use of this product as of the date of this Material Safety Data Sheet. Since the use of this information and of these opinions or the conditions of use of the product are not within the control of Harsco Corporation, it is the user's obligation to determine and observe the conditions of safe use and disposal of the product by their operations.

INTEROFFICE MEMO

October 31, 1991

TO: TOM SHAW

FROM: MIKE WELLS

SUBJECT: PAINT FILTER LIQUID TEST

A Paint Filter Liquid Test was performed according to EPA Method 9095 on the following sample with results as shown:

CL #	DESCRIPTION	RESULTS
16504	Wilson Barge Unloader Blasting Grit	Passed*

*Deemed to be free of liquids for purposes of 40 CFR 264.314 and 265.314. No material passed through filter during designated period.

A. GENERAL INFORMATION:

1. Landfill Name: [illegible] 2. County: [illegible]

3. Landfill Permit #: [illegible] 4. Expires: [illegible]

B. APPROVAL:

The Division of Waste Management, Department for Environmental Protection, Natural Resources and Environmental Protection Cabinet, modifies the landfill permit cited in Section IVA of this application to allow disposal of the waste described herein. The Division reserves the right to modify or revoke this approval. This approval is invalid in the absence of a valid permit or if disposal is not in accordance with description herein or conditions described below.

Date: AUG 2 3 1992

George F. Gilbert, Jr., Manager
Solid Waste Branch
Division of Waste Management

C. DENIAL:

The Division of Waste Management, Department for Environmental Protection, Natural Resources and Environmental Protection Cabinet, rejects this application for the reason(s) stated below:

I. WASTE GENERATOR INFORMATION

A. GENERATOR IDENTIFICATION:

1. Name: Big Rivers Electric Corp D.B. Wilson Station
2. Mailing Address: P.O. Box 24 Henderson KY 4242 ATT: Tom Shaw
3. Address Where Waste Generated: P.O. Box 547 Centertown KY 42328
4. Contact Person: Tom Shaw 5. Telephone: 502 827-2561

B. WASTE DESCRIPTION:

1. Waste Name: Abrasive blasting grit contaminated with non lead-base paint.
   Describe source of the waste including industrial process: Abrasive blasting with Black Beauty grit the clarifier clarifier
2. Is the waste hazardous under 401 KAR 31:010, Section 3, which includes the characteristics of 401 KAR 31:030 and the lists of 401 KAR 31:040? ☐ Yes ☒ No (If yes, contact your local Division of Waste Management Field Office for further assistance. See instructions for locations and telephone numbers.)
3. Is the waste an "exempt" hazardous waste under the regulatory cites in the Instructions? ☐ Yes ☒ No
   Regulatory Cite:

RECEIVED
JAN 10 1992

SOLID WASTE BRANCH

4. Waste Condition Upon Generation: ☒ Solid ☐ Semi-solid ☐ Liquid ☐ Other
5. Waste Treatment Description: None this is.
6. Disposal Site Name: Big Rivers Electric Corp. D.B Wilson Station 7. Permit # 092.04
8. Waste Condition Upon Disposal: ☑ Solid ☐ Semi-solid ☐ Liquid ☐ Other
9. Waste Amount: _____ 55-gal. drums or 6080 Cubic Yards (Note: 1 cubic yard = 202 gallons)
10. Frequency: ☐ Per Month ☒ Per Year ☐ One-Time Only

C. CONTAINER TYPE *(See Instructions)*:

☐ Paper bag _____ ☐ Fiber drum or cardboard box _____ ☐ Metal or plastic drum _____
☐ Plastic bag _____ ☐ Double bagged in container _____ ☐ Other *(specify)* _____
☒ Bulk _____ ☐ Mixed with plant trash _____

D. FEE:

Check payable to "KENTUCKY STATE TREASURER." *(MAIL CHECK DIRECTLY TO SOLID WASTE BRANCH, DIVISION OF WASTE MANAGEMENT, 18 REILLY ROAD, FRANKFORT, KENTUCKY 40601)*
Check for $50.00 # 140032

E. SOLID WASTE GENERATOR CERTIFICATION:

I certify that the information set forth in Section I pertaining to the waste is true and correct and that the waste is not regulated as a hazardous waste under 401 KAR Chapter 31 which requires storage, treatment or disposal at a hazardous waste facility under 401 KAR Chapters 32 through 40. I understand that failure to properly manage a hazardous waste could lead to possible civil and criminal penalties under KRS Chapter 224 or the Resource Conservation and Recovery Act of 1976, (Public Law 94-580), as amended.

Signature of Authorized Agent: Joe L. Craig Date: 7/29/91
Name of Authorized Agent *(typed or printed)*: Joe L. Craig Title: Vice General Manager

of Fuels, Environmental Affairs, and Information Systems

GENERATOR: Big Rivers Electric Corp. D.B. Wilson Station PAGE 2 OF

WASTE NAME: Abrasive blasting grit contaminated with non-lead base paint DATE: 7-29-91

II. LABORATORY INFORMATION ATTACHED

A. LABORATORY IDENTIFICATION:

1. Laboratory Name: _____
2. Mailing Address: _____
3. Contact Person: _____ 4. Telephone: _____

B. SAMPLE COLLECTION:

1. Sampler Name: _____
2. Company: _____

C. SAMPLE CONTAINER:

1. Container Type: ☐ Glass ☐ Plastic ☐ Other (explain) _____
2. Sample Type: ☐ Composite ☐ Grab ☐ Other (explain) _____
3. Size of Container: _____
4. Preservative: _____

D. WASTE CHARACTERISTICS:

1. Does the waste exhibit the characteristic of a hazardous waste as described in 401 KAR 31:030:

CHARACTERISTICS	YES	NO	ANALYSIS
Ignitability	☐	☐	Flashpoint _____ °F
Corrosivity	☐	☐	pH _____
Reactivity	☐	☐	_____ mg/kg ☐ H_2S ☐ HCN
EP Toxicity	☐	☐	Contaminant(s) _____ mg/l

2. Is the waste characteristically hazardous? ☐ Yes ☐ No
3. Waste passed paint filter test? ☐ Yes ☐ No 4. Solids Content: _____

E. LABORATORY CERTIFICATION:

I certify the above results are true and correct and analyses were conducted in accordance with EPA publication SW-846 "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods."

Signature of Laboratory Analyst: _____ Date: _____

IV. LANDFILL INFORMATION

A. DISPOSAL SITE IDENTIFICATION:

1. Landfill Name: Big Rivers Electric Corp. D.B. Wilson 2. Permit #: 0220-04

3. Mailing Address: P.O. Box 543 Centertown KY 42328 Att. Tom Sloan

4. Contact Person: Tom Sloan 5. Telephone:

B. INSTRUCTIONS TO GENERATOR:

1. Time of Day Waste is to be Delivered: 7:30 am to 2:30 pm

2. Special handling requirements: Cover with poly-plastic

3. Comments

C. DISPOSAL METHOD:

☐ Bury in container ☐ Co-mix with garbage ☒ Bury at bottom of lift ☐ Per EPA asbestos procedure

☐ Other

D. LANDFILL CERTIFICATION:

I certify that I [ ] will not or [ ] if approved, will accept the waste described in Section I for the landfill named in Section IV.A. I propose to use the method of disposal described in Section IV, C. above. Failure to use the described, approved procedure may constitute illegal disposal. The waste to be received under this permit modification is compatible to the above mentioned landfill operation.

Black Beauty

REED MINERALS

MATERIAL SAFETY DATA SHEET

(Complies with 29 CFR 1910.1200)

SECTION I - GENERAL

Reed Minerals
A Division of Harsco Corporation
3149 C Kennedy Avenue
Highland, IN 46322
Emergency Telephone Number:
(219) 923-4200

Product Name: Black Beauty®
Abrasives
CAS Number : 68476-86-0
Particulates not
otherwise regulated.
Common Name : Boiler Slag
Date : April 15, 1987
Revised : August 1, 1988
2nd Revision: September 1, 1989

SECTION II - INGREDIENTS

	OSHA *PEL	ACGIH *TLV
Boiler Slag 100% (Typically as an amorphous mixture of Fe,Al,Ca silicates)	Nuisance Dust	
	Total Dust : 15	10
	Respirable Dust : 5	5

*Values Expressed as mg/M^3

SECTION III - PHYSICAL DATA

Physical Form	: Solid (angular granules)
Boiling Temperature	: N/A
Melting Temperature	: greater than 2300^0F
Vapor Pressure/Density	: N/A
Evaporation Rate	: N/A
Specific Gravity	: 2.7 g/cc (typical)
Water Solubility	: Negligible
Color	: Black
Odor	: None

SECTION IV - FIRE AND EXPLOSION DATA

Product is non-flammable and non-explosive.

SECTION V - REACTIVITY DATA

Product is stable under normal conditions of use, storage, and transportation.

Black Beauty
Black Magic

SECTION VI - HEALTH HAZARD DATA

Low health risk by inhalation. Treat as a nuisance dust. Typical free silica less than 0.1%. Human toxic response has not been demonstrated for any route of entry. Mechanical irritation may occur to eyes, skin, or respiratory tract. Pre-existing health conditions may be aggravated.

Carcinogenicity: NTP - No
IARC Monographs - No
OSHA Regulated - No

FIRST AID

In case of:

1. Eye contact - Immediately flush eyes thoroughly with water.
2. Skin contact - Wash skin with soap and water if irritation occurs.
3. Inhalation - Remove effected person(s) to fresh air source.
4. Oral Intake - Rinse mouth out with water.

If symptoms persist, contact a physician or other medical personnel.

SECTION VII - SPILL, LEAK, AND DISPOSAL PROCEDURES

No special procedures required for clean-up. Wetting with water will reduce airborne dust. Uncontaminated product does not exhibit characteristic EP Toxicity and may be disposed of as inert material in an appropriate solid waste landfill according to applicable Federal, State, and Local regulations.

SECTION VIII - CONTROL MEASURES

Use appropriate NIOSH certified respiratory protection when exposure limits may be exceeded. Maintain sufficient ventilation to allow visual contact with work surfaces. Appropriate abrasive blaster's protective equipment is required, which may also include gloves, hood with protective lens, safety glasses, and hearing protection.

SECTION IX - SPECIAL PRECAUTIONS

Keep product dry and free of all contamination to assure free flow. Use an appropriate safety screen over fill hatch of blasting pot. Respirable dusts may be generated during pressure abrasive cleaning operations.

- N O T E -

V. DIVISION OF WASTE MANAGEMENT FINAL DETERMINATION

A. GENERAL INFORMATION:

1. Landfill Name _____ 2. County: _____

3. Landfill Permit #: _____ 4. Expires: _____

B. APPROVAL:

The Division of Waste Management, Department for Environmental Protection, Natural Resources and Environmental Protection Cabinet, modifies the landfill permit cited in Section IVA of this application to allow disposal of the waste described herein. The Division reserves the right to modify or revoke this approval. This approval is invalid in the absence of a valid permit or if disposal is not in accordance with description herein or conditions described below.

Date: _____

George F. Gilbert, Jr., Manager
Solid Waste Branch
Division of Waste Management

C. DENIAL:

The Division of Waste Management, Department for Environmental Protection, Natural Resources and Environmental Protection Cabinet, rejects this application for the reason(s) stated below:

Date: _____

George F. Gilbert, Jr., Manager
Solid Waste Branch

Mr. Mark Crum
Natural Resources And Environmental
Protection Cabinet
Frankfort Office Park
14 Reilly Road
Frankfort, KY 40601

Dear Mr. Crum:

Please find enclosed the corrected additional wastestream applications. The application for abrasive blasting contaminated with iron oxide (01-330) has been withdrawn.

If you have any questions, please contact me at (502)827-2561 ext. 2855.

Sincerely,

Thomas L. Shaw
Senior Environmental Scientist

A. GENERATOR IDENTIFICATION:

1. Name: Big Rivers Electric Corp D. B. Wilson
2. Mailing Address: P.O. Box 24 Henderson KY 42420 ATT. Tom Shaw
3. Address Where Waste Generated: P.O. Box 547 ~~Sebree~~ Centertown KY 42328 ATT Tom Shaw
4. Contact Person: Tom Shaw 5. Telephone: _____

B. WASTE DESCRIPTION:

1. Waste Name: Abrasive blasting contaminated with coal tar ~~epoxy~~ epoxy

   Describe source of the waste including industrial process: Abrasive blasting with Black Beauty the FGD system outlet duct to remove coal tar epoxy from the steel.

2. Is the waste hazardous under 401 KAR 31:010, Section 3, which includes the characteristics of 401 KAR 31:030 and the lists of 401 KAR 31:040? ☐ Yes ☐ No (If yes, contact your local Division of Waste Management Field Office for further assistance. See instructions for locations and telephone numbers.)
3. Is the waste an "exempt" hazardous waste under the regulatory cites in the Instructions? ☐ Yes ☐ No

   Regulatory Cite: _____

4. Waste Condition Upon Generation: ☑ Solid ☐ Semi-solid ☐ Liquid ☐ Other _____
5. Waste Treatment Description: New Cents
6. Disposal Site Name: Big Rivers Electric Corp D.B. Wilson Station Permit # 092.04
8. Waste Condition Upon Disposal: ☒ Solid ☐ Semi-solid ☐ Liquid ☐ Other _____
9. Waste Amount: _____ 55-gal. drums or 25 Cubic Yards (Note: 1 cubic yard = 202 gallons)
10. Frequency: ☐ Per Month ☒ Per Year ☐ One-Time Only

C. CONTAINER TYPE *(See Instructions)*:

☐ Paper bag _____ ☐ Fiber drum or cardboard box _____ ☐ Metal or plastic drum _____

☐ Plastic bag _____ ☐ Double bagged in container _____ ☐ Other *(specify)* _____

☒ Bulk _____ ☐ Mixed with plant trash _____

D. FEE:

Check payable to "KENTUCKY STATE TREASURER." *(MAIL CHECK DIRECTLY TO SOLID WASTE BRANCH, DIVISION OF WASTE MANAGEMENT, 18 REILLY ROAD, FRANKFORT, KENTUCKY 40601)*

Check for $50.00 # 140032

E. SOLID WASTE GENERATOR CERTIFICATION:

I certify that the information set forth in Section I pertaining to the waste is true and correct and that the waste is not regulated as a hazardous waste under 401 KAR Chapter 31 which requires storage, treatment or disposal at a hazardous waste facility under 401 KAR Chapters 32 through 40. I understand that failure to properly manage a hazardous waste could lead to possible civil and criminal penalties under KRS Chapter 224 or the Resource Conservation and Recovery Act of 1976, (Public Law 94-580), as amended.

Signature of Authorized Agent: Joe L. Craig Date: 7/29/91

C. SAMPLE CONTAINER:

1. Container Type: ☐ Glass ☐ Plastic ☐ Other (*explain*) _____
2. Sample Type: ☐ Composite ☐ Grab ☐ Other (*explain*) _____
3. Size of Container: _____
4. Preservative: _____

D. WASTE CHARACTERISTICS:

1. Does the waste exhibit the characteristic of a hazardous waste as described in 401 KAR 31:030:

CHARACTERISTICS	YES	NO	ANALYSIS
Ignitability	☐	☐	Flashpoint _____ °F
Corrosivity	☐	☐	pH _____
Reactivity	☐	☐	_____ mg/kg ☐ H_2S ☐ HCN
EP Toxicity	☐	☐	Contaminant(s) _____ _____ mg/l

2. Is the waste characteristically hazardous? ☐ Yes ☐ No
3. Waste passed paint filter test? ☐ Yes ☐ No 4. Solids Content: _____

E. LABORATORY CERTIFICATION:

I certify the above results are true and correct and analyses were conducted in accordance with EPA publication SW-846 "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods."

Signature of Laboratory Analyst: _____ Date: _____

ATTACH LABORATORY RESULTS

F. MATERIAL SAFETY DATA SHEET:

1. Attached ☒ Yes ☐ No

III. TRANSPORTER INFORMATION

A. HAULER IDENTIFICATION:

1. Hauler Name: Big Rivers Electric Corp D.B. Wilson
2. Mailing Address: _____
3. Contact Person: Tom Sinard 4. Telephone: 502 827 2561

B. SECONDARY HAULER IDENTIFICATION:

1. Hauler Name: _____
2. Mailing Address: _____
3. Contact Person: _____ 4 Telephone: _____

GENERATOR: Big Rivers Electric Corp. D.B. Wilson

WASTE NAME: Abrasive blasting contaminated with coal tar epoxy DATE: 6-14-04

IV. LANDFILL INFORMATION

A. DISPOSAL SITE IDENTIFICATION:

1. Landfill Name: Big Rivers Electric Corp D.B. Wilson 2. Permit #: 0920-04
3. Mailing Address: PO Box 343 Centertown KY 42328 Att: Tim Sons
4. Contact Person: Tim Sons 5. Telephone:

B. INSTRUCTIONS TO GENERATOR:

1. Time of Day Waste is to be Delivered: 7:30 to 3:30 pm
2. Special handling requirements: Cover with pre-cover tarp

3. Comments:

C. DISPOSAL METHOD:

☐ Bury in container ☐ Co-mix with garbage ☑ Bury at bottom of lift ☐ Per EPA asbestos procedure

☐ Other

D. LANDFILL CERTIFICATION:

I certify that I ☐ will not or ☐ if approved, will accept the waste described in Section I at the landfill named in Section IV.A. I propose to use the method of disposal described in Section IV. C. above. Failure to use the described, approved procedure may constitute illegal disposal. The waste to be received under this permit modification is compatible to the above mentioned landfill operation.

Signature of Authorized Agent for Landfill: Date: 7-27-04

MATERIAL SAFETY DATA SHEET

NFCA 1-82

FOR COATINGS, RESINS AND RELATED MATERIALS

7001
7005

(Revision of U.S. Department of Labor Essentially Similar to Form OSHA 20)

Section I

MANUFACTURER'S NAME: PORTER PAINT CO.

DATE OF PREP: 11/16/84

STREET ADDRESS: 400 South 13th Street

CITY, STATE AND ZIP CODE: Louisville, KY 40201

EMERGENCY TELEPHONE NO: (502) 588-9250

INFORMATION TELEPHONE NO: (502) 588-9200

PRODUCT CLASS: Coal Tar Epoxy

MANUFACTURER'S CODE IDENTIFICATION

TRADE NAME

7001 Tarset Standard (Part A)
7005 Tarset Catalyst (Part B)

Section II—HAZARDOUS INGREDIENTS

INGREDIENT	PERCENT A	PERCENT B	PERCENT A+B	OCCUPATIONAL EXPOSURE LIMITS (TLV)	VAPOR PRESSURE (@ 20°C)	TOXICITY DATA
Coal Tar Pitch Volatiles (benzene solubles), CAS #8007-45-2	<1		<1	0.2 mg/m³		skin, inhalatir
Hi Flash Naphtha		30	<1	200 ppm	<2.0	
Xylene, CAS #1330-20-7	5		<5	100 ppm	5.1	
Coal Tar Naphtha, CAS #MX8030-31-7	15		15	100 ppm *		
Diethylenetriamine, CAS #111-40-0		65	2	1 ppm		skin, pulmonary sensitizer
Benzene, CAS #71-43-2	<0.1			10 ppm		≤ 45 mg/m³

**by volume

* Indene present, TLV of 10 ppm

Section III—PHYSICAL DATA

BOILING RANGE: 282-374°F

VAPOR DENSITY: LIGHTER THAN AIR

HEAVIER: A=30

WEIGHT PER GALLON: A=11.0 lbs. B=7.2 lbs. A+B=10.8 lbs.

EVAPORATION RATE: FASTER SLOWER THAN ETHER

PERCENT VOLATILE BY VOLUME: B=13, A+B=30

Section IV—FIRE AND EXPLOSION HAZARD DATA

FLAMMABILITY CLASSIFICATION: Combustible Liquid, OSHA Class IIIA, DOT Combustible

FLASH POINT: A=101°F B=115°F A+B=101°F

LEL: 0.7

EXTINGUISHING MEDIA

FOAM | CO2 | LIQUID | DRY CHEMICAL | WATER FOG | OTHER

UNUSUAL FIRE AND EXPLOSION HAZARDS

Keep containers tightly closed. Isolate from heat, sparks, electrical equipment, and open flame. Closed containers may explode when exposed to extreme heat. In absence of electricity water spray (fog nozzle preferred) may be used to cool containers. Avoid exposure to decomposition products. Wear self-contained breathing equipment.

Section V—HEALTH HAZARD D. A

[illegible]

Inhalation: Irritation of the respiratory tract or acute nervous system causing headache/dizziness, nausea.

Acute: Eye and Skin: Primary irritation. Photo sensitization may occur.

Chronic: Prolonged or repeated exposures may lead to dermatitis, skin cancer. DETA has potential to be a pulmonary sensitizer.

EMERGENCY AND FIRST AID PROCEDURES

Vapors: Remove from exposure. Restore breathing. Keep warm and quiet. Notify physician.

Splash (Eyes): Flush immediately with large amounts of water for at least 15 minutes. Take to physician for medical treatment.

Splash (Skin): Wash affected areas with water. Remove contaminated clothing.

Section VI—REACTIVITY DATA

STABILITY (CONSIDER TO BE) STABLE CONDITIONS TO AVOID

INCOMPATABILITY (MATERIALS TO AVOID)

HAZARDOUS DECOMPOSITION PRODUCTS

May produce hazardous fumes when heated to decomposition as in welding. Fumes may contain CO

HAZARDOUS POLYMERIZATION (WILL OCCUR) X (WILL NOT OCCUR)

Section VII—SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED

Remove all sources of ignition (flames, hot surfaces, and electrical, static or friction sparks). Avoid breathing vapors. Ventilate area. Remove with inert absorbent and use non-sparking tools.

WASTE DISPOSAL METHOD: Dispose of in a safe manner in accordance with local, state, and federal regulations. Do not incinerate closed containers.

Section VIII—SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION In outdoor or open areas with unrestricted ventilation, use NIOSH/MSHA-approved filter respirator to remove solid airborne particles of overspray during spray application. In restricted ventilation areas use approved mechanical filter respirators designed to remove particulates, gas and vapor. In confined areas, use approved air line type respirators and hood. VENTILATION: Provide general dilution or local exhaust ventilation in volume and pattern to keep the TLV's and the LEL below the stated limits and to remove decomposition products during welding or flame cutting of surfaces coated with this product.

PROTECTIVE GLOVES Required for prolonged or repeated contact.

EYE PROTECTION Must use safety eyewear with splash guards or side shields.

OTHER PROTECTIVE EQUIPMENT Remove and wash contaminated clothing.

Section IX—SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING Secure closures and keep containers upright to prevent leakage. Store large quantities only in buildings designed to comply with OSHA 1910.106. Other Precautions:Do not store above 120°F. Do not take internally. Before smoking or eating, clean hands thoroughly. Do not get on skin or in eyes. Avoid breathing vapors or spray mist. Avoid storing or using near heat, sparks, or flame. Containers should be grounded when pouring. Avoid free fall of liquid in excess of a few inches. Do not flame cut, braze or weld without approved respirator or appropriate ventilation. All electrical equipment and installations should be made and grounded in accordance with the National Electrical Code. Workmen should be required to use only non-ferrous tools and wear non-sparking and conductive shoes in areas where explosion hazards exist.

Black Mineral

REED MINERALS

MATERIAL SAFETY DATA SHEET

(Complies with 29 CFR 1910.1200)

SECTION I - GENERAL

Reed Minerals
A Division of Hanaco Corporation
9149 C Kennedy Avenue
Highland, IN 46322
Emergency Telephone Number:
(219) 923-4200

Product Name: Black Beauty®
Abrasives
CAS Number : 68476-96-0
Particulates not
otherwise regulated.
Common Name : Boiler Slag
Date : April 15, 1987
Revised : August 1, 1996
2nd Revision: September 1, 1999

SECTION II - INGREDIENTS

	OSHA *PEL	ACGIH *TLV
Boiler Slag 100% (Typically as an amorphous mixture of Fe,Al,Ca silicates)		
Nuisance Dust		
Total Dust :	15	10
Respirable Dust :	3	5

*Values Expressed as mg/M^3

SECTION III - PHYSICAL DATA

Physical Form	: Solid (angular granules)
Boiling Temperature	: N/A
Melting Temperature	: greater than 2300°F
Vapor Pressure/Density	: N/A
Evaporation Rate	: N/A
Specific Gravity	: 2.7 g/cc (typical)
Water Solubility -	: Negligible
Color	: Black
Odor	: None

SECTION IV - FIRE AND EXPLOSION DATA

Product is non-flammable and non-explosive.

SECTION V - REACTIVITY DATA

Product is stable under normal conditions of use, storage, and transportation.

Glass Media

SECTION VI - HEALTH HAZARD DATA

Low health risk by inhalation. Treat as a nuisance dust. Typical free silica less than 0.1%. Human toxic response has not been demonstrated for any route of entry. Mechanical irritation may occur to eyes, skin, or respiratory tract. Pre-existing health conditions may be aggravated.

Carcinogenicity: NTP - No
IARC Monographs - No
OSHA Regulated - No

FIRST AID

In case of:

1. Eye contact - Immediately flush eyes thoroughly with water.

2. Skin contact - Wash skin with soap and water if irritation occurs.

3. Inhalation - Remove effected person(s) to fresh air source.

4. Oral intake - Rinse mouth out with water.

If symptoms persist, contact a physician or other medical personnel.

SECTION VII - SPILL, LEAK, AND DISPOSAL PROCEDURES

No special procedures required for clean-up. Wetting with water will reduce airborne dust. Uncontaminated product does not exhibit characteristic EP Toxicity and may be disposed of as inert material in an appropriate solid waste landfill according to applicable Federal, State, and Local regulations.

SECTION VIII - CONTROL MEASURES

Use appropriate NIOSH certified respiratory protection when exposure limits may be exceeded. Maintain sufficient ventilation to allow visual contact with work surfaces. Appropriate abrasive blaster's protective equipment is required, which may also include gloves, hood with protective lens, safety glasses, and hearing protection.

SECTION IX - SPECIAL PRECAUTIONS

Keep product dry and free of all contamination to assure free flow. Use an appropriate safety screen over fill hatch of blasting pot. Respirable dusts may be generated during pressure abrasive cleaning operations.

TEN DAY REPORT FORM FOR PRIOR NOTIFICATION OF ASBESTOS ABATEMENT ACTIVITIES

This form is to be filled out and filed with the Division for Air Quality at least ten (10) days before starting the asbestos removal or any prep or other work which would disturb the asbestos-containing material (ACM). For projects in Jefferson County, file with the Air Pollution Control District of Jefferson County.

Notifications should be numbered (top right), with first two digits being the project year and remaining digits being the project number (for example, first project in 1991 is number 91-1). After notification is filed, if developments (e.g., changes in dates, amounts, locations) occur that invalidate reported information, an amended form must be filed. If new start date is earlier than start date on file, submit amended schedule not later than 10 days before the new start date. Delayed removal/disposal dates must be submitted at least one day prior to the most current removal/disposal date on file. Submit other amendments (including amount changes of greater than 20% or 160SF/ 260LF) at least one day before the fact. Amended form should be a copy of the original form, with corrections pencilled in, including the new "Revised Date."

TEN DAY REPORT FORM FOR PRIOR NOTIFICATION OF ASBESTOS ABATEMENT ACTIVITIES

This form is to be filled out and filed with the Division for Air Quality at least ten (10) days before starting the asbestos abatement project (20 days for demolitions involving less than 160 square feet or 260 linear feet of friable asbestos material). For projects in Jefferson County, file with the Air Pollution Control District of Jefferson County.

Notifications should be numbered (top right), with the first two digits being the project year and the remaining digits being the project number (for example, first project in 1990 is number 90-1). After a notification is filed, if developments (e.g., changes in dates, amounts, locations) occur that will invalidate information provided on the form on file, then an amended form must be filed immediately. Amended removal or disposal schedules must be submitted at least one day prior to the removal/disposal date on file or the new removal/disposal date, whichever is earlier. The amended form can be a copy of the original form, with corrections penciled in.

TEN DAY REPORT FORM FOR PRIOR NOTIFICATION OF ASBESTOS ABATEMENT ACTIVITIES

This form is to be filled out and filed with the Division for Air Quality at least ten (10) days before starting the asbestos abatement project (20 days for demolitions involving less than 160 square feet or 260 linear feet of friable asbestos material). For projects in Jefferson County, file with the Air Pollution Control District of Jefferson County.

Notifications should be numbered (top right), with the first two digits being the project year and the remaining digits being the project number (for example, first project in 1990 is number 90-1). After a notification is filed, if developments (e.g., changes in dates, amounts, locations) occur that will invalidate information provided on the form on file, then an amended form must be filed immediately. Amended removal or disposal schedules must be submitted at least one day prior to the removal/disposal date on file or the new removal/disposal date, whichever is earlier. The amended form can be a copy of the original form, with corrections penciled in.

TEN DAY REPORT FORM FOR PRIOR NOTIFICATION OF ASBESTOS ABATEMENT ACTIVITIES

This form is to be filled out and filed with the Division for Air Quality at least ten (10) days before starting the asbestos abatement project (20 days for demolitions involving less than 160 square feet or 260 linear feet of friable asbestos material). For projects in Jefferson County, file with the Air Pollution Control District of Jefferson County.

Notifications should be numbered (top right), with the first two digits being the project year and the remaining digits being the project number (for example, first project in 1990 is number 90-1). After a notification is filed, if developments (e.g., changes in dates, amounts, locations) occur that will invalidate information provided on the form on file, then an amended form must be filed immediately. Amended removal or disposal schedules must be submitted at least one day prior to the removal/disposal date on file or the new removal/disposal date, whichever is earlier. The amended form can be a copy of the original form, with corrections pencilled in.

TEN DAY REPORT FORM FOR PRIOR NOTIFICATION OF ASBESTOS ABATEMENT ACTIVITIES

This form is to be filled out and filed with the Division for Air Quality at least ten (10) days before starting the asbestos abatement project (20 days for demolitions involving less than 160 square feet or 260 linear feet of friable asbestos material). For projects in Jefferson County, file with the Air Pollution Control District of Jefferson County.

Notifications should be numbered (top right), with the first two digits being the project year and the remaining digits being the project number (for example, first project in 1990 is number 90-1). After a notification is filed, if developments (e.g., changes in dates, amounts, locations) occur that will invalidate information provided on the form on file, then an amended form must be filed immediately. Amended removal or disposal schedules must be submitted at least one day prior to the removal/disposal date on file or the new removal/disposal date, whichever is earlier. The amended form can be a copy of the original form, with corrections pencilled in.

AUG 26 1991

TEN DAY REPORT FORM FOR PRIOR NOTIFICATION OF ASBESTOS ABATEMENT ACTIVITIES

This form is to be filled out and filed with the Division for Air Quality at least ten (10) days before starting the asbestos abatement project (20 days for demolitions involving less than 160 square feet or 260 linear feet of friable asbestos material). For projects in Jefferson County, file with the Air Pollution Control District of Jefferson County.

Notifications should be numbered (top right), with the first two digits being the project year and the remaining digits being the project number (for example, first project in 1990 is number 90-1). After a notification is filed, if developments (e.g., changes in dates, amounts, locations) occur that will invalidate information provided on the form on file, then an amended form must be filed immediately. Amended removal or disposal schedules must be submitted at least one day prior to the removal/disposal date on file or the new removal/disposal date, whichever is earlier. The amended form can be a copy of the original form, with corrections pencilled in.

Notifications should be numbered (top right), with the first two digits being the project year and the remaining digits being the project number (for example, first project in 1990 is number 90-1). After a notification is filed, if developments (e.g., changes in dates, amounts, locations) occur that will invalidate information provided on the form on file, then an amended form must be filed immediately. Amended removal or disposal schedules must be submitted at least one day prior to the removal/disposal date on file or the new removal/disposal date, whichever is earlier. The amended form can be a copy of the original form, with corrections pencilled in.

TEN DAY REPORT FORM FOR PRIOR NOTIFICATION OF ASBESTOS ABATEMENT ACTIVITIES

This form is to be filled out and filed with the Division for Air Quality at least ten (10) days before starting the asbestos abatement project (20 days for demolitions involving less than 160 square feet or 260 linear feet of friable asbestos material). For projects in Jefferson County, file with the Air Pollution Control District of Jefferson County.

Notifications should be numbered (top right), with the first two digits being the project year and the remaining digits being the project number (for example, first project in 1990 is number 90-1). After a notification is filed, if developments (e.g., changes in dates, amounts, locations) occur that will invalidate information provided on the form on file, then an amended form must be filed immediately. Amended removal or disposal schedules must be submitted at least one day prior to the removal/disposal date on file or the new removal/disposal date, whichever is earlier. The amended form can be a copy of the original form, with corrections pencilled in.

TEN DAY REPORT FORM FOR PRIOR NOTIFICATION OF ASBESTOS ABATEMENT ACTIVITIES

This form is to be filled out and filed with the Division for Air Quality at least ten (10) days before starting the asbestos abatement project (20 days for demolitions involving less than 160 square [illegible] or 260 linear [illegible] of friable asbestos material). For projects in Jefferson County, file with the Air Pollution Control District of Jefferson County.

Notifications should be numbered (top right), with the first two digits being the project year and the remaining digits being the project number (for example, first project in 1990 is number 90-1). After a notification is filed, if developments (e.g., changes in dates, amounts, locations) occur that will invalidate information provided on the form on file, then an amended form must be filed immediately. Amended removal or disposal schedules must be submitted at least one day prior to the removal/disposal date on file or the new removal/disposal date, whichever is earlier. The amended form can be a copy of the original form, with corrections penciled in.

KYD-000-622-928: Big Rivers Electric Corporation, Kenneth C. Coleman, Station, Hancock County

Dear Mr. Shaw:

The Division of Waste Management received the 1987 Hazardous Waste Annual Report from your company at three locations indicated above. Our records indicate that those three locations are registered with the Division as limited quantity generators.

The limited quantity generators are not required to submit the Annual Reports. Therefore, no annual report requirements from those three locations. Only full quantity generators and small quantity generators are required to submit the Annual Reports.

If you have any questions concerning this matter, please call me at (502) 564-6716.

Sincerely,

Suda Vtl

KENTUCKY DEPARTMENT FOR ENVIRONMENTAL PROTECTION

RECEIVED
FEB 18 1988
DWM/PROGRAM DEVELOPMENT BRANCH

1987 HAZARDOUS WASTE ANNUAL REPORT
FOR ~~SMALL~~ LIMITED QUANTITY GENERATORS

INSTRUCTIONS: All registered Small Quantity Generators must complete this report. The report covers hazardous wastes generated during 1987. Copies of the Hazardous Waste Manifests kept by your company for the calendar year 1987 should be used to prepare this report. The report must be typed or printed legibly. All information categories should be completed fully. All EPA ID Numbers should be checked to insure that they are accurate and contain twelve digits. Return the completed report with an original signature and date - copies of the signature are not acceptable. Instructions on this form are in italics. **THE REPORT MUST BE RECEIVED BY THE KENTUCKY DIVISION OF WASTE MANAGEMENT, 18 REILLY ROAD, FRANKFORT, KY 40601 BY MARCH 1, 1988.**

(1) **GENERATOR EPA ID NUMBER:** KYD01-257-6286
Write your company's EPA Identification Number as it appears on your Certificate of Registration. All EPA ID Numbers contain 12 digits. For example: K Y D - 0 0 0 - 0 0 0 - 0 0 0. Please check all EPA ID Numbers to insure that they are accurate and contain twelve digits.

(2) **COUNTY:** Ohio
Write the name of the county where your company is located.

(3) **GENERATOR NAME:** D.B. Wilson Power Plant
Write your company's name, as it appears on your Certificate of Registration.

(4) **GENERATOR MAILING ADDRESS:** 201 Third St.
Henderson, KY 42420
Write the complete mailing address for your company. Correspondence about your Annual Report will be sent to this address.

(5) **CONTACT PERSON:** Thomas L. Shaw
Write the person's name who can be contacted about your company's report.

(6) **CONTACT PERSON'S TELEPHONE NUMBER:** (502) 827-2561 Ext. 2855
Write the telephone number (please include area code) of the "contact person."

(7) **SIC CODES:** (1) 4911 (2) _____ (3) _____ (4) _____
Write up to four of the four-digit Standard Industrial Classification Code(s) which best describe your company's business. Use only four-digit codes. A list of SIC Codes are found on the back of this page. If you cannot find the right SIC Code for your company, call the Annual Report Coordinator at (502) 564-6716.

(8) **WASTE MINIMIZATION STATEMENT:** *Generators are required to try to reduce the quantity or toxicity of their hazardous waste. Some examples of waste minimization efforts would include incineration (volume reduction), solvent recovery (volume reduction), and neutralization (reduction of toxicity). Your hazardous waste minimization program can be done by your company (on-site) or by a waste management company (off-site) or both.*

☐ YES ☐ NO **IN 1987, AS A SMALL QUANTITY GENERATOR OF HAZARDOUS WASTE, MY COMPANY MADE A GOOD FAITH EFFORT TO MINIMIZE WASTE GENERATION AND SELECT THE BEST WASTE MANAGEMENT METHOD THAT WAS AVAILABLE AND AFFORDABLE.**

• IF YES, EXPLAIN BRIEFLY: (1) WHAT YOUR COMPANY DID IN 1987 TO REDUCE THE VOLUME AND TOXICITY OF WASTE GENERATED (SEE EXAMPLES ABOVE), AND (2) AN ESTIMATE OF HOW MUCH WASTE REDUCTION WAS ACHIEVED IN 1987.

Hazardous or toxic wastes was not produced at this facility during 1987.
Big Rivers is in the process of moving to a limited quantity generator status.

(9) **CERTIFICATION:**
I CERTIFY UNDER PENALTY OF LAW THAT I HAVE PERSONALLY EXAMINED AND AM FAMILIAR WITH THE INFORMATION SUBMITTED IN THIS AND ALL ATTACHED DOCUMENTS, AND THAT BASED ON MY INQUIRY OF THOSE INDIVIDUALS IMMEDIATELY RESPONSIBLE FOR OBTAINING THE INFORMATION, I BELIEVE THAT THE SUBMITTED INFORMATION IS TRUE, ACCURATE, AND COMPLETE. I AM AWARE THAT THERE ARE SIGNIFICANT PENALTIES FOR SUBMITTING FALSE INFORMATION, INCLUDING THE POSSIBILITY OF FINE AND IMPRISONMENT.

(10) TRANSPORTATION SERVICES USED TO SEND WASTE OFF-SITE: REPORT YEAR: 1987

If your company sent hazardous waste off-site, complete each of the columns in the following table using your copies of the manifest forms. See instructions below for completing each column. If your company did not ship hazardous waste off-site, leave this section blank. An example is shown in the first line of the table.

PRIMARY TRANSPORTER (from the Manifest form)	NUMBER OF MANIFESTED SHIPMENTS TRANSPORTED	TOTAL QUANTITY	UNIT of volume	CONTAINER TYPES USED
ID NUMBER: *KYD-000-111-222* NAME: *Supertanker Truck Lines* ADDRESS: *123 North Main Street – Louisville, KY 40229*	*5*	*1523*	*G*	*DM, TT*
ID NUMBER: NAME: ADDRESS: NON-APPLICABLE				
ID NUMBER: NAME: ADDRESS:				
ID NUMBER: NAME: ADDRESS:				
ID NUMBER: NAME: ADDRESS:				

COPY EXTRA SHEETS AS NECESSARY TO SHOW ALL WASTE TRANSPORTED FROM YOUR COMPANY IN 1987.

INSTRUCTIONS FOR THE TABLE ON TRANSPORTATION SERVICES USED TO SEND WASTE OFF-SITE:

Primary Transporter: *List every transporter shown as a "Primary" or "#1" transporter on your copies of the manifest forms who transported waste from your company to an off-site treatment, storage or disposal facility. Write each Transporter's EPA ID Number, name and address.*

Number of Manifested Shipments Transported: *For each "Primary Transporter," count the number of manifested shipments that were transported and write this number in the space provided. Count each manifest form only once.*

Total Quantity: *Add together all hazardous wastes which were transported by each "Primary Transporter" for the calendar year 1987 and write the total amount of waste transported by that company in the space provided. Do not show individual quantities of waste by waste type or container type. When non-hazardous wastes were sent off-site with a manifest, the entire amount of waste should be reported. If non-hazardous wastes are reported, explain it in the "Comments" category (see item # 11 below).*

Unit of Volume: *Write the unit of measure for "Total Quantity" using the following codes:*

VOLUME:

- P = *Pounds*
- G = *Gallons*
- Y = *Cubic Yard*
- K = *Kilograms*
- L = *Liters*
- C = *Cubic Meter*
- T = *Tons (2000 pounds)*
- M = *Tonnes (1000 kg)*

DENSITY - FOR GASES ONLY:

- P/G = *Pounds per Gallon*
- T/Y = *Short tons (2000 lbs) per Cubic Yard*
- K/L = *Kilograms per Liter*
- M/C = *Tonnes (1000 kg) per Cubic Meter*

Container Types Used For Transporting: *Write every different container type shown on all the manifest forms which were used for transporting your waste off-site using the following codes:*

- DM = *Metal drums, barrels, kegs*
- DW = *Wooden drums, barrels, kegs*
- DF = *Fiberboard or plastic drums, barrels, kegs*
- TP = *Tanks, portable*
- CM = *Metal boxes, cartons, cases*
- TT = *Cargo tanks (tank trucks)*
- TC = *Tank cars*
- DT = *Dump truck*
- CY = *Cylinders*
- UN = *Unknown or unspecified on the manifest*
- CW = *Wooden boxes, cartons, cases*
- CF = *Fiber or plastic boxes, cartons, cases*
- BA = *Burlap, cloth, paper or plastic bags*
- OT = *Other, specify in "Comments"*

(11) COMMENTS: *Use this space to explain any item on this page.*

(12) GENERATOR EPA ID NUMBER: KYD-012-576-286

Write your company's EPA Identification Number. All EPA ID Numbers contain 12 digits. For example: KYD-000-000-000

(16) GENERATOR WASTE SUMMARY SHEET:

REPORT YEAR: 1987

See instructions on the back of the preceding page for completing the table. An example is shown in line number A.

(17) COMMENTS: *Use this space to explain any item on this page.*

(18) GENERATOR EPA ID NUMBER: K Y D 1 1 1 2 2 2 3 3 3

Write your company's EPA Identification Number. All EPA ID Numbers contain 12 digits. For example, K Y D 0 9 0 0 0 0 0 0

(13) SUMMARY OF FACILITIES RECEIVING WASTE.

REPORT YEAR: 1987

See instructions below for completing table. An example is shown in the first line of the table.

RECEIVING FACILITY'S EPA ID NUMBER	RECEIVING FACILITY'S NAME	TOTAL NUMBER OF MANIFESTED SHIPMENTS SENT TO FACILITY	TOTAL QUANTITY OF WASTE SENT TO FACILITY	UNIT OF VOLUME
KYD-111-222-333	*Ace Waste Disposal Company*	*5*	*1523*	*G*
	NON-APPLICABLE			

COPY EXTRA SHEETS AS NECESSARY TO SHOW ALL FACILITIES WHICH RECEIVED WASTE FROM YOUR COMPANY IN 1987

INSTRUCTIONS FOR COMPLETING SUMMARY OF FACILITIES RECEIVING WASTE:

RECEIVING FACILITY'S EPA ID NUMBER: *Write the EPA ID Numbers of every facility to which your company sent waste for treatment, storage or disposal.*

RECEIVING FACILITY'S NAME: *Using the manifest forms, write the name of each facility where your company sent waste for treatment, storage or disposal. If your company operated an on-site treatment, storage, or disposal facility (i.e., storage for more than 180 days), and received waste in 1987, write your company's name in the space provided.*

TOTAL NUMBER OF MANIFESTED SHIPMENTS SENT TO FACILITY: *For each Receiving Facility, count the number of manifested shipments that were sent to each facility and write that number in the space provided. Count each manifest form only once.*

TOTAL QUANTITY OF WASTE SENT TO FACILITY: *Write the total quantity of waste sent to each facility in 1987 from your company. Do not identify individual quantities of waste by type or amount. When manifested shipments included non-hazardous wastes, the entire amount of waste should be reported. If non-hazardous wastes are reported, make a note of the quantity of non-hazardous waste in the "Comments" category (see item # 14 below).*

UNIT OF VOLUME: *Write the unit of measure for "Total Quantity" using the following codes:*

VOLUME:

- P = *Pounds*
- G = *Gallons*
- Y = *Cubic Yards*
- K = *Kilograms*
- M = *Tonnes (1000 kg)*
- L = *Liters*
- C = *Cubic Meters*
- T = *Tons (2000 pounds)*

DENSITY - FOR GASES ONLY:

- P/G = *Pounds per Gallon*
- T/Y = *Short Tons (2000 lbs) per Cubic Yard*
- K/L = *Kilograms per Liter*
- M/C = *Tonnes (1000 kg) per Cubic Meter*

(14) COMMENTS. *Use this space to explain any item on this page.*

(15) GENERATOR EPA ID NUMBER: [illegible]

Write your company's EPA Identification Number. All EPA ID Numbers contain 12 digits. For example: K Y D - 0 0 0 - 0 0 0 - 0 2 0

[4] - Based on unconfined samples	[10] - Moisture content based on sample weight after testing

LABORATORY TESTING PROCEDURES

Unconfined Compression Tests: The unconfined compression test is an unconsolidated-undrained triaxial shear test with no lateral confining pressure. This test is used to determine the shear strength of clayey soils.

An unconfined compression test is performed according to ASTM D 2166 on a single section of a remolded sample extruded from a standard Proctor test mold. Incrementally increasing vertical loads are applied until the sample fails. Test results are provided in the form of a stress-strain curve or a value representing the unconfined compressive strength of the sample. No corrections for length to diameter ratios were made.

Triaxial Shear Tests: Triaxial shear tests are used to determine the strength characteristics and friction angle of a given soil sample. Triaxial tests are also used to determine the elastic properties of the soil specimen.

Triaxial shear tests are performed on several sections of a relatively undisturbed sample extruded from the sampling tube. The samples were extruded from 2.8 inches diameter tubes and encased in rubber membranes. Each is then placed in a compression chamber and confined by all around water pressure and back pressure saturated. Samples are then subjected to additional axial and/or lateral loads, depending on the soil and the field conditions to be simulated. The test results are typically presented in tabular form or in the form of stress-strain curves and Mohr envelopes or p-q plots. Consolidated-Undrained (Designated as a CU or R Test) with pore water measurements were performed.

Consolidation Tests: Consolidation tests are conducted on representative soil samples to determine the change in height of the sample with increasing load. The results of these tests are used to estimate the settlement and time rate of settlement of structures constructed on similar soils.

A consolidation test is performed according to ASTM D 2435 on a single section of an undisturbed sample extruded from a sample tube. The sample is trimmed into a disc 2.5 inches in diameter and 0.75 inch thick. The disc is confined in a stainless steel ring and sandwiched between porous plates. It is then subjected to incrementally increasing vertical loads, and the resulting deformations are measured with a micrometer dial gauge. Void ratios are then calculated from these deformation readings. The test results are typically provided in tabular form or in the form of plots of void ratio versus applied stress (e-log p_{curve}v).

Permeability Tests: The permeability test is used to measure the ease with which water will flow through soil. The test was performed on remolded samples. The samples were placed in a triaxial cell and encased in a rubber membrane and sandwiched between porous plates. Water is forced to flow through the sample and the rate of flow is determined. Triaxial cell including back-pressure saturation were used for the sludge mixes.

Moisture Content: The Moisture Content is determined according to ASTM D 2216. A drying temperature of 135°F was used.

1.0 INTRODUCTION

This Construction Quality Assurance/Quality Control Plan (CQA Plan) has been developed in support of the Permit application for a coal combustion residual (CCR) disposal facility cap to be located at Big Rivers Electric Corporation D.B. Wilson Generating Station in Island, Kentucky. The landfill is located in the Northwest corner of the generating station.

This CQA Plan has been developed in accordance with rules published by the applicable federal CCR Rule, OSHA and Kentucky Administrative Regulations (KAR). Big Rivers is requesting that KAR issue a permit for the construction and operation of the proposed CCR disposal facility as a residual landfill permit.

1.1 PURPOSE

The purpose of this Construction Quality Assurance (CQA) Plan is to outline the observation and testing requirements needed to document and verify the following:

- How each new constructed solid waste disposal facility unit(s) liner(s) and/or lateral expansion liner(s) and cover system(s) will be inspected and/or tested by a registered engineer as required by CCR Rule and KAR applicable regulations during construction or installation for uniformity, damage, and imperfections;
- How each constructed section of the liner system or final cover system will be certified by a registered engineer; and
- The engineered components meet the lines and grades shown in the construction drawings and conform to the specifications in CCR the construction documents.

1.2 CONTENTS

This CQA Plan details the personnel qualifications, material requirements, sampling and testing procedures, testing frequency, testing parameters and sampling locations, surveying, required documentation and the procedures to follow in the case of a test failure.

The construction related procedures addressed in the following sections are presented to direct construction personnel for development of the site. The CQA Plan has been organized into the following Sections as listed below:

SECTION	TITLE
1.0	Introduction
2.0	Project Description
3.0	QA/QC Program
4.0	Prequalification Testing
5.0	Earth Material
6.0	Aggregates
7.0	Final Cover System
8.0	Geomembrane
9.0	Geotextile
10.0	HDPE Pipe
11.0	Surface Water Control Systems
12.0	ClosureTurf

2.0 PROJECT DESCRIPTION

2.1 SITE LOCATION

The D.B. Wilson Generating Station is located at 5663 KY-85 near Centertown in Island, Kentucky. The generating station is located east of Green River. The existing CCR disposal facility is located in the northwest corner of the plant. Raymond Rail Rd borders the landfill at the northeast corner.

2.2 CURRENT CONDITIONS

Big Rivers Electric Corporation's D.B. Wilson Generating Station is a 417 MW coal-fired power plant. The plant was built in 1984 and disposes of coal ash and other CCR at the uncapped landfill. For phase 1, the 100-acre landfill is completely filled and awaiting capping. CCR material produced now is stored at a separate landfill west of the separating power line.

3.0 QA/QC PROGRAM

Although they are related, there is a significant difference between Quality Assurance and Quality Control. These elements are often confused and interchanged because they are interdependent. Quality Assurance (QA) relies on the Quality Control (QC) feedback and both work to deliver good quality products and services. Although this plan is focused on construction quality assurance, it necessarily also contains items associated with quality control.

3.1 QUALITY ASSURANCE

Quality Assurance starts at the beginning of the project during preparation of the engineering plans and specifications. At this stage, the CQA Plan outlines means and actions to be employed by the Owner to evaluate and measure conformity with the design, production (manufacture and fabrication), and installation of equipment and materials in accordance with this CQA Plan as well as with the plans and specifications.

3.2 QUALITY CONTROL

Quality Control includes actions taken by all parties including the designer, manufacturer, fabricator, and/or Contractor, to ensure that their methods, materials, and workmanship are accurate and correct and meet the project requirements, in accordance with the approved plans and specifications. QC is provided by each party for its own work, product, or service.

3.3 ROLES AND RESPONSIBILITIES

3.3.1 OWNER AND OPERATOR

The plant and its ancillary functions are owned and operated by the Big Rivers Electric Corporation (Owner). The Owner will be responsible for overall management of construction activities including contracting and administration. The Owner will designate an on-site representative to serve as Owner's Representative.

3.3.2 OWNER'S REPRESENTATIVE

An official representative of the Owner or Operator responsible for planning, organizing, and controlling construction activities.

3.3.3 CONTRACTOR

The Contractor for this project will be selected by the Owner. The Contractor is responsible for construction activities associated with this project including meeting all the requirements for project quality as defined in the construction plans and specifications for his/her work as well as that of his/her Subcontractors.

3.3.3.1 Construction Quality Assurance Professional of Record (POR)

The POR is an authorized representative of the Owner and has overall responsibility for CQA efforts and to confirm the project was constructed in

general accordance with site-specific specifications approved by the regulatory authority and contract documents. The POR must be licensed as a Professional Engineer in the State the project is located and experienced in geosynthetics.

3.3.3.2 Subcontractors

The Owner will subcontract with a construction material testing and inspection firm for field and laboratory testing as needed. The Owner will provide technicians for testing and observance including:

- Drilling and subsurface exploration
- Specialty geotechnical services
- Submersible pump installation
- Surveying services

Laboratory testing may include:

- Soil testing
- Concrete testing
- Geosynthetic testing

3.3.3.3 Stop Work Authority

The Owner will advise that the Contractor should stop work in situations of recognizable stability issues, deviations from design and significant cost or schedule impacts. In situations where personnel safety is concerned, the Owner will advise the Contractor to stop work as soon as possible of that action.

3.4 Project Meetings

To achieve a high degree of quality during installation, clear, open channels of communication are essential. The following meetings should be held when appropriate.

3.4.1 Pre-Construction Meetings

Following the completion of the contract documents, Pre-Construction Meeting may be held. At a minimum, the meeting should be attended by the Project Manager, the Owner's POR, the Owner's representative, the Geosynthetics Installer's Superintendent, the Earthwork Contractor's Superintendent, the Design Engineer, the Permitting Agency and other involved parties. Two Pre-Construction Meetings may be held, one prior to earthwork construction and one prior to geosynthetic placement.

3.4.2 Daily Meetings

A daily meeting will be held, as necessary, between the Owner, the Geosynthetic Installer, the Contractor, and other involved parties. Those attending will discuss, plan, coordinate the work, and CQA activities to be completed that day.

3.4.3 Progress Meetings

Progress meetings will be held weekly, or as determined to be necessary by the Owner. Attendees should include the Owner, the Geosynthetic Installer, the Contractor, and other involved parties. Those attending will discuss current progress, planned activities for the next week, submittals, and new business or revisions to the work. The Owner will log problems, decisions, or questions arising at this meeting.

3.4.4 Problem or Work Deficiency Meeting

A special meeting may be held when and if a problem or deficiency, which would impact the construction schedule or other project requirements, is present or likely to occur. At a minimum, the meeting should be attended by the affected Contractors, the Project Manager, and the Owner. The purpose of the meeting is to define and resolve the problem or work deficiency.

3.4.5 Safety Meetings

The Contractor will hold safety meetings in accordance with the Contractor's Site Health and Safety Plan. The Contractor's Site Health and Safety Plan must be submitted to the Owner for approval prior to commencing construction activities. Meetings will be held at the start of construction and then periodically as conditions change or as determined by the Owner's Representative.

3.4.6 Geosynthetics Pre-Construction Meeting

A meeting will be held at the project site prior to the installation of any geosynthetics components of the composite liner or final cover system. The Geosynthetics Pre-Construction Meeting will be attended by the Contractor, Geosynthetics Installer, or other representative of the Owner. These meetings will be held to discuss submittals, materials, installation procedures, and project coordination.

3.5 Documentation

An effective CQA plan depends largely on recognition of construction activities that should be monitored, and assigning monitoring responsibilities. This is most effectively accomplished and verified through quality assurance activities. The Owner will document that quality assurance requirements have been addressed and satisfied.

The Owner will prepare and provide periodic signed reports which summarize construction activities and the results of observations and tests including descriptive remarks, data sheets, and logs to verify that all quality assurance monitoring activities have been carried out.

Owner will provide two (2) day notice to DWM for conducting inspections at critical phases of construction including, but not limited to, the geosynthetics soil base placement, geomembrane installation, ClosureTurf installation, and final inspection.

DWM will be contacted when each cap component is completed so that a DWM representative may inspect the cap component prior to the next component being installed per 401 KAR 45:110 Section 5. Please provide DWM a minimum of a two (2) working day notice for the inspection to be scheduled.

3.5.1 REPORTS

Progress reports will be prepared at regular time intervals to document the status of the work by the Owner. Certifications will be prepared at the completion of major construction activities. At the completion of the work, final documentation will be prepared and will include a professional engineer's seal along with supporting field and laboratory test results.

Construction Progress Report shall contain all necessary conformance testing for each type of synthetic utilized per 401 KAR 45:110 Sections 2 and 5. This is to ensure the synthetic material used met project specifications.

3.5.1.1 Daily Summary Report

Standard reporting procedures must include preparation of a daily report which, at a minimum, will consist of:

- An identifying sheet number for cross referencing and document control
- Date, project name/number, location, and other identification
- A summary report including memoranda of meetings and/or relevant discussions with the Owner, and/or site contractors, observation logs, test data sheets, decisions reached, activities planned and their schedule
- Other forms of daily recordkeeping to be used as appropriate including construction problem and solution data sheets and photographic reporting data sheets

The daily summary report will also include the following information as needed:

- Weather conditions
- A reduced-scale site plan showing all proposed work areas and test locations
- Descriptions and locations of ongoing construction
- Descriptions and specific locations of areas, or units, of work being tested and/or observed and documented
- Locations where tests and samples were taken or reference to specific observation logs and/or test data sheets where such information can be found

- A summary of field/laboratory test results or reference to specific observation logs and/or test data sheets
- Calibrations or recalibration of test equipment and actions taken as a result of recalibration, or reference to specific observation logs and/or test data sheets
- Off-site materials received, including quality verification documentation
- Decisions made regarding acceptance of units of work, and/or corrective actions to be taken in instances of substandard quality
- The Owner's signature

This information must be regularly submitted to and reviewed by the Owner's Representative.

3.5.1.2 Observation Logs and Test Data Sheets

Observations of construction and QA-related activities will be recorded on project-specific logs and data sheets by the Owner. At a minimum, the logs and data sheets will include the following information:

- An identifying sheet numbered for cross referencing and document control
- Date, project name, location, and other identification; Description or title of activity monitored
- Location of activity and locations of samples collected
- Locations of field tests performed and their results
- Results of laboratory tests received
- Results of monitoring activity in comparison to specifications
- The Owner's signature

This information will be submitted with the Daily Summary Report during construction projects.

3.5.1.3 Construction Certification Report

At the completion of the work, a signed Construction Certification Report will be prepared by the Owner prepared in accordance with the project requirements.

The Construction Certification Report will be prepared and signed and sealed by a professional engineer skilled in the appropriate discipline(s) and registered in the state in which the work was performed.

At a minimum, the Construction Certification Report will include:

1. A narrative section that identifies the engineered components that were constructed that includes the following:

- A summary of the design and construction specifications and a comparison with the components that were constructed during the construction event
- A summary of how construction was impacted by weather and equipment limitations and other difficulties encountered

2. All alterations and other changes that relate to the installation of any of the components to be certified and presented as follows:
   - A listing of all applicable alteration requests/changes that were previously concurred with
   - All alteration requests/changes and supporting documentation which are proposed for concurrence
   - A list of any other changes made by the owner or operator which do not require regulatory concurrence but which affect construction or the record drawings

The alteration request will be equivalent or more protective than the applicable regulation or authorizing document.

3. Results of all tests and QA/QC data including manufacturers' certifications in accordance with the project specifications.
4. Results of all surveys in accordance with the project specifications. Unless otherwise specified, the survey data will be reported in a table(s) displaying the northing and easting for each designated survey point established to be no more than one hundred feet apart based on the grid system coincident with the design drawings. Additional points will be established at grade breaks and other critical locations.
5. Record drawings of the constructed facility components showing the following:
   - The location of all survey control points.
   - Plan views with topographic representation of all engineered components depicted along with critical elevations such as pipe inverts, sump elevations, ditch flow lines, tops and toes of berms, locations of repairs, etc.
   - The location and as-built detail drawings of all components to be certified.
   - If the Certification Report is submitted for the composite final cover system, cross sections showing the top elevations of the existing waste, top elevation of the composite cap system, and the elevations of the surface water management system. The cross sections will be taken at the same locations and using the same scale as in the approved permit to install. Otherwise, the cross sections will be taken at an interval no greater than every three hundred feet of length and width.

- If the Certification Report is submitted for establishment of facility survey marks, the following information summarizing the activities performed to construct and establish the facility survey marks:
    - An identification and description of the known control point(s) used to establish the horizontal and vertical coordinate(s) of the facility survey marks.
    - The horizontal and vertical coordinates of the known control point(s) and facility survey marks.
    - A summary of surveying activities performed in determining the coordinates of the facility survey marks.
    - A copy of the 7.5-minute series quadrangle sheet(s) used in establishing the survey marks with the known control point(s) and the location of the facility survey marks clearly identified.
    - A detailed drawing(s) illustrating the design of the facility survey marks, as constructed.

6. Qualifications of testing personnel that provided construction oversight and conducted all the testing on the engineered components for which the Certification Report is submitted including a description of the experience, training, responsibilities in decision making, and other relevant qualifications.
7. A notarized statement that, to the best of the knowledge of the owner or operator, the Certification Report is true, accurate, and contains all information required by this rule and by the CQA plan.

3.5.1.4 Progress Reports

Progress reports at time intervals established at the Pre-Construction Meeting will be completed. At a minimum, this report will include the following information:

- A unique identifying sheet number for cross-referencing and document control
- The date, project name, location, and other information
- A summary of work activities during progress reporting period
- A summary of construction situations, deficiencies, and/or defects occurring during the progress reporting period
- The signature of the Owner's representative

Copies of progress reports will be distributed as decided at the Progress Meetings and as determined necessary by the Owner's Representative.

3.5.1.5 Photographic Reporting Data Sheets

Photographic reporting data sheets, where used, will be cross-referenced with observation logs and test data sheets and/or construction problem and solution reports. These photographs will serve as a pictorial record of work progress, problems, and mitigation activities. These records will be presented to the Project Manager upon completion of the project.

3.5.2 DESIGN AND/OR SPECIFICATION CHANGES

Design and/or specification changes may be required during construction. In such cases, the Owner will notify the representative. The Owner's Representative will then determine the cause of the non-conformance and recommend appropriate changes in procedures or specifications. These changes will be submitted to the Permitting Agency if necessary.

When this type of evaluation is made, the results will be documented with a description of the changes by the Owner's Representative and cross-referenced to specific observation logs and test data sheets.

These reports must include the following information:

- An identifying sheet number for cross-referencing and document control
- A detailed description of the situation or deficiency
- The location and probable cause of the situation or deficiency
- How and when the situation or deficiency was identified or located
- Documentation of the corrective action taken to address the situation or deficiency
- Any measures taken to prevent a similar situation from occurring in the future
- The signature of the Owner's Representative and POR indicating concurrence

Design and/or specifications changes will be made only with the written agreement of the Owner, and will take the form of an addendum to the specifications.

3.5.2.1 Agency Approval

Once any field deviations or alterations that have been approved by the owner, DWM approval must be sought and obtained prior to commencing of the deviation or alteration work per 401 KAR 45:110 Sections 2 and 5. The Construction Progress Report may not be found acceptable if this action is not completed. All field deviations shall be specified in the Construction Progress Reports.

3.5.3 DOCUMENTATION MANAGEMENT

The Contractor and Owner's representative will submit project documentation to the Owner on a weekly basis or an alternate frequency established by the project requirements.

Complete project CQA documentation must be collected and maintained on-site by the Owner in a safe repository. This includes (but is not limited to):

- A complete set of construction drawings and specifications
- The CQA Plan
- Project checklists, test procedures, and standards
- Project test procedures, daily logs, pertinent regulatory documents, and other necessary documents.

3.5.4 Storage of Records and Records Retention

All data sheet originals related to the CQA and Certification process, test results, daily logs, memorandums, etc., will be stored by the Owner in a safe repository on-site during the construction project.

Upon completion of the construction project, records will either be retained at the facility or alternately stored at the Owner's or POR's office and be readily accessible by the facility if requested. Records will be maintained for a minimum period of three years from the project completion.

3.6 Failed Test Procedures and Alterations

A "failed test" occurs when a test performed on an engineered component yields a result that does not meet the specifications outlined in the applicable plans or specifications. Testing performed on an engineered component which does not meet the specifications is not considered a failed test if the engineered component is undergoing construction or installation at the time of testing and the testing is performed for the purpose of gauging the effectiveness or completeness of construction. Any failed area, where test results demonstrate that the area does not meet project specifications or regulatory requirements, must be reworked or repaired until the area passes per 401 KAR 45:110 Sections 2 and 5.

An "alteration" or "field change" is a change in construction materials, specifications, or CQA procedures from the project requirements that is necessary to perform the work or meet project requirements.

3.6.1 Failed Test Prior To Certification Report Submittal

If, prior to submission of the Construction Certification Report for the engineered component, the Owner determines that there is a "failed test," the Owner will perform all the following:

- Retest or otherwise assess the engineered component or portion of the facility to determine if construction is in compliance with the construction plans and

specifications or other project requirements and include the final results in the Certification Report.

- Implement measures to attain compliance with the construction plans and specifications or other project requirements. An area with a verified failure must be reconstructed. Reconstructed areas must be retested at a frequency acceptable to the Owner and at a frequency and location(s) sufficient to demonstrate that compliance has been achieved.

3.6.2 Alteration Prior to Submittal of Certification Report

If, prior to submission of the Construction Certification Report the Owner determines that an alteration or field change is necessary to the plans or specifications, the Owner will do all of the following:

- Include the applicable testing results and an assessment and justification for the necessary change(s) in an appropriate section of the Certification Report where the change is clearly identified.
- Provide a demonstration in the Certification Report that the change(s) are at least equivalent to the project requirements, the construction plans and specifications, and are at least as protective to human health and the environment.
- Submit the Certification Report as required by the Owner's Representative.

3.6.3 Detection of the Change after Submittal of the Certification Report

If, after submission of the Construction Certification Report the Owner's Representative determines that the Certification Report is in error due to improper documentation of an alteration or field change of the plans or specifications, the Owner will do all of the following:

- Notify the Owner's Representative as determined by the POR of the change within twenty-four hours after discovery, by phone and within seven days after discovery in writing.
- Within fourteen days of submitting the written notification required above, do either of the following:
  a. Implement the failed test procedures outlined above (3.6.1) and amend and resubmit the Construction Certification Report to explain the circumstances and how compliance was achieved.
  b. Submit the Alteration information outlined above (Section 3.6.2).

3.7 OWNER DOCUMENTATION

Appendix A of this CQA Plan includes examples of Construction Documentation Forms that will be generated by the Owner. These forms may be modified as deemed appropriate based on the requirements of the Owner's Representative .

3.8 SURVEYING

Surveying of lines and grades will be conducted on an ongoing basis during construction of soil layers, geosynthetics placement, and other engineered components. Surveying will be performed to provide documentation for record plans, verifying quantities, and assist the Contractor in complying with the required grades. Surveying conducted at the site must be part of the CQA program. The purpose of the survey is to verify that actual thickness and grades of the construction components are in accordance with the plans and specifications. Surveying of lines and grades will be conducted during construction of the soil layers. Review of the surveys conducted at the site will be part of the CQA program. The permanent benchmarks at the facility will be used for survey control. Surveying will be performed under the supervision of a qualified, professional Land Surveyor licensed in Kentucky.

Based on the control points provided by the Owner, the Contractor is to provide all temporary and permanent benchmarks, monuments, and increments needed to control work. If during the work, control points set by the Owner are disturbed by the Contractor, the Contractor will replace the control points.

3.8.1 SURVEY CONTROL

The permanent benchmarks at the facility will be used for survey control. One or more temporary benchmarks will be established for the site at a location convenient for daily tie-in. Temporary benchmarks are to be considered as accurate as third order benchmarks. The vertical and horizontal controls for this benchmark will be established within normal land surveying standards.

All benchmarks established at the facility will comply with the following requirements:

- At least three permanent survey marks, with each located on separate sides of the facility, will be established prior to any construction and within easy access to the limits of solid waste.
- Survey marks will be referenced to the same horizontal (BRF Plant Local Ground) and vertical datum (National Geodetic Vertical Datum of 1929) used on the design plans.
- Survey marks will be at least as stable as a poured concrete monument 10-inches in diameter installed to a depth of 42-inches below the ground surface. Each constructed survey mark will include a corrosion resistant metallic disk which indicates horizontal and vertical coordinates of the survey mark and will contain a magnet or ferromagnetic rod to allow identification through magnetic detection methods.

Survey control standards for the survey marks will be in accordance with the following:

- For the first facility survey mark established from the known control point, minimum horizontal distance accuracy will be one foot horizontal to two thousand five hundred feet horizontal (1' Horiz : 2500' Horiz).
- For each facility survey mark established from the first facility survey mark, minimum horizontal accuracy will be one-foot horizontal distance to five thousand feet horizontal (1' Horiz : 5000' Horiz).
- For the first facility survey mark established from the known control point and for each facility survey mark established from the first facility survey mark, minimum vertical accuracy will be one inch to five thousand feet horizontal (1" Vert : 5000' Horiz).

3.8.2 Precision and Accuracy

The survey instruments used for this work will be precise and accurate to meet the needs of the project. Survey instruments will be capable of reading to a precision of 0.01 of a foot (3.1 mm) and with a setting accuracy of 10 seconds.

A vertical tolerance of ±0.30 feet will apply to each of the following components as they are constructed:

- Top of sand infill layer
- Invert of pipes

Note: These tolerances are meant to assure that the required design intent can be met upon final certification. A Professional Surveyor registered in Kentucky will certify results of the survey. Results will be included in the Certification Report provided to the Owner.

3.8.3 Frequency and Spacing

Surveying will be performed as soon as possible after completion of a given installation to facilitate progress and avoid delaying the next installation. In addition, spot checks during construction will be necessary to assist the Contractor in complying with the required grades.

The as-built thickness of various components of the facility (protective covers and geosynthetic clay liners) will be determined by non-destructive methods, i.e., comparison of the survey data for the underlying materials with that of the component of interest. As-built survey data will be obtained at locations having a typical on center spacing of 100-feet maximum, at all toe, midpoint, and top of slope locations as well as grade breaks. Locations will be, to the maximum extent possible, at the same coordinates as the survey data for the underlying materials.

3.8.4 LINES AND GRADES

When required, the extent of the following components will be surveyed to determine the lines and grades achieved during construction:

- Original ground surface/Existing conditions
- Surface of excavation after stripping of vegetation
- Alignment and inverts of underdrain piping
- Final sand infill layer
- Geomembrane including anchor trenches, panel layout, destruct locations, repairs, and penetrations
- Geosynthetics (other than geomembrane) including anchor trenches
- Leachate collection and conveyance piping including alignment, inverts, valve box locations, and termination points.
- Surface water structure details including profiles, cross sections, and inverts for ditches, culverts, catch basins, swales, benches, ditches, and sedimentation basins
- Alignment and inverts of piping (both inside and outside the facility)
- As-built line and grade of all other piping structures
- Roads including profiles and cross sections with a minimum of one cross section for every 300 linear feet of waste containment area will be surveyed.

3.8.5 SURVEYING PERSONNEL

Surveying for construction certification and record documentation purposes will be performed under the supervision of a qualified, licensed Professional Land Surveyor registered in the state of Kentucky. The survey crew will consist of a Senior Surveyor and as many Surveying Assistants as required to satisfactorily undertake the work. Surveying personnel will be experienced in the provision of these services, including detailed, accurate documentation.

3.8.6 CERTIFICATION

Survey results will be certified by a licensed Professional Land Surveyor licensed in the state where the work is performed and submitted to the Owner for review.

3.8.7 SURVEYS BY OWNER OR ENGINEER

The Owner may request additional surveys to monitor, verify, or document the work.

3.9 PROJECT SCHEDULE

A detailed project schedule will be required to be provided by the Contractor to the Owner's Representative for review and approval prior to the preconstruction meeting. The schedule must

be generated using Primavera P6 software and composed of detailed activities logically tied together. The Contractor will construct the schedule to have the following attributes at a minimum:

- Schedule narrative describing the logic for the work planned
- Clearly defined starting point
- Clearly defined completion date
- Project Milestones
- Mobilization and demobilization activities
- Critical paths identified
- Tasks that represent the performance of the work, including tangible deliverables or products
- Specifies the resources required to perform the work (This will include labor, equipment, and materials)
- Can be easily measured during the performance of the detailed activity relating to the work

All details in the project schedule will be logically tied to other activities. As a general guideline for generating schedules, the duration of an activity should be limited to 14 calendar days. In no case should an individual work activity be scheduled for a duration longer than 45 calendar days without approval from Big Rivers. If any portion of the project is to be accomplished during a plant outage, those scheduled activities should be incorporated into a separate hourly schedule. The work should be broken down into sufficient enough detail to allow the maximum use of finish-to-start relationships. In addition, start-to-start, finish-to-finish, or start-to-finish relationships will be used at a minimum. In no case will negative lag values be allowed for any relationships. In all cases, any exceptions to the above criteria must have Big River's management's approval.

Individual activities in the project schedule requiring identifiable labor to complete the project will be resource loaded with all necessary engineering labor hours, project support labor hours and/or craft labor hours consistent with the Contractor's estimate, scope of work and work assignments. Progress for scheduled tasks will be tracked using physical percent complete. All significant reductions in physical percent complete will be reported in the weekly report along with an explanation.

4.0 PREQUALIFICATION TESTING

4.1 SUMMARY

The following section discusses the specific QA/QC requirements for prequalification conformance testing of the engineered components for the disposal facility.

4.2 PREQUALIFICATION CONFORMANCE TESTING

Prequalification testing is necessary to establish that the materials used for the engineered components conform to the minimum specifications contained in this document for each component. Some prequalification testing is generally necessary for any engineered component comprised in whole or in part of aggregate, recompacted clay, or geosynthetics. Conformance testing is performed on representative materials obtained from the location of origin and results submitted prior to arrival on site unless otherwise directed by the Owner's representative .

For this CQA Plan, prequalification conformance testing is divided between material characteristics testing and interface friction testing. Interface friction related testing shall be conducted per ASTM D5321 on appropriate geomembrane samples with all underlying soil/CCR types. Material characteristics testing is contained in Tables 3 through 7 as applicable for each engineered component. Soil and aggregate laboratory and field testing methods are located in Table 1A and 1B. Minimum testing requirements and frequencies for soils and aggregates are located in Table 3. Tables 4 through 8 contain testing requirements for geosynthetic components.

4.3 ENGINEERED COMPONENTS REQUIRING PREQUALIFICATION CONFORMANCE TESTING

Engineered components that require some measure of prequalification are noted in the individual specifications under submittals. These materials are summarized as follows:

- Geomembrane
- Engineered Synthetic Turf
- Geotextile
- HDPE Pipe
- Surface Water Structures

4.4 SUBMITTALS

Submit the results of all required prequalification testing including interface friction testing to the Owner for review and verification that the reported test results meet with project specifications at least 14 calendar days prior to use of the material at the job site unless otherwise directed by the Owner.

5.0 EARTH MATERIAL

5.1 SUBGRADE EXCAVATION AND COMPACTION OF IN-SITU MATERIALS

Subgrade or in-situ foundation refers to a surface exposed after stripping topsoil/fill material or excavating to grades. Structures or foundations, manholes, aggregate drainage materials, or aggregate surface materials are placed on the subgrade. Materials such as organics or soft/loose soils will be removed. All unsuitable soil located below the subgrade elevations shall be over-excavated to a competent, stable surface at a lower elevation and replaced with suitable fill material as directed by the Owner's Representative. In addition, any significant protrusions resulting from small cobbles and/or large boulders shall be removed and replaced with suitable fill as appropriate such that the final subgrade surface is relatively smooth. Proofrolling is not appropriate on the slopes of the closure cap.

In addition, any significant protrusions resulting from small cobbles and/or large boulders shall be removed and replaced with approved fill as appropriate such that the final subgrade surface is relatively smooth.

5.1.1 CONSTRUCTION

Where necessary, suitable backfill will be placed in horizontal loose-lifts that do not exceed 8-inches in thickness. Each lift shall be compacted using suitable equipment to achieve the minimum in-place density specified in Table 3. The contractor shall adjust the moisture content of the fill material as needed to meet the specified moisture/density requirements.

5.1.2 CONSTRUCTION TESTING

The Owner is responsible for pre-qualification testing of proposed sources of any backfill material. In-place testing shall consist of visual inspection by the installer and the owner/engineer in accordance with the requirements listed in Table 3.

6.0 AGGREGATES

Aggregates include materials used for the construction of the bedding/backfill of piping, slope and channel protection (rip rap), proposed access road, and under structures.

6.1 MATERIAL, CONSTRUCTION, AND DESIGN SPECIFICATIONS

Material and construction specifications for aggregates are set forth in Table 3.

6.2 PRE-CONSTRUCTION MANUFACTURER/CONFORMANCE TESTING

Aggregate materials for use shall be obtained from approved off-site borrow sources and shall satisfy the requirements in the Contract Documents throughout delivery and use of the materials. The contractor shall submit certified laboratory test reports for each proposed aggregate source or supplier stating that the material meets the requirements for aggregates as set forth in Table 3.

6.3 CONSTRUCTION

Aggregate materials shall be placed using equipment and methods that protect underlying pipe materials and geotextiles. Aggregates for bedding and backfill of pipes and structures should be placed to the thickness and elevations shown on the plans and tamped in place to achieve compaction.

Rip rap shall be placed in a manner that will produce a well-graded mass of stone with smaller stone fragments filling the space between the larger ones, so as to result in the minimum practicable percentage of voids. The final section of stone filling shall be in conformance with the lines, grades, and thicknesses as shown on the Construction Drawings. Rip rap shall not be placed or dropped from a height greater than 24". Riprap placed onto any Geosynthetics shall not be placed or dropped from a height greater than 12". The contractor is responsible for determining a riprap placement method that will not damage the underlying geosynthetics. Aggregates for the access road shall be spread in uniform loose lifts and compacted with a compactor until the specified density is reached or until the material passes a proofroll.

6.4 CONSTRUCTION TESTING

Observation of aggregate placement should document that the correct materials are utilized, and thicknesses of the layers are attained to meet the design intent. For aggregate used in bedding

and backfill of structures, the aggregate should be field observed to document that it meets the project requirements.

7.0 FINAL COVER SYSTEM

Prior to placement of the final cover system geomembrane, the intermediate cover soil layer shall be stripped of existing vegetation and any unsuitable materials removed from the surface of the intermediate cover soil. The surface shall be been rolled with a smooth steel wheel roller, pneumatic wheel roller, or other means to provide a surface free of irregularities, loose earth, and abrupt changes in grade.

Prior to placement of the final cover system geomembrane, the Owner's Representative shall:

- Observe that surfaces on which the geomembrane is to be placed are at the design line and grade and have been rolled with a smooth steel wheel roller, pneumatic wheel roller, or other means to provide a surface free of irregularities, loose earth, and abrupt changes in grade.
- Observe the prepared intermediate cover with the Geomembrane Contractor for approval. Receive an acceptance of the surface condition from the geomembrane installer.
- Observe that prepared subgrade is maintained in a smooth, uniform, and compacted condition during installation of the geosynthetic lining system. If drying, cracking, erosion, or other damage has occurred, observe that it is repaired before installing the liner.
- Observe that adequate drainage for the prepared subgrade is provided and maintained until the lining installation is completed. The geomembrane should not be placed if moisture prevents proper subgrade preparation, placement, or membrane seaming.

8.0 GEOMEMBRANE

8.1 GENERAL

8.1.1 SUMMARY

The following section discusses the specific QA/QC requirements for the testing and installation of this material. Geomembrane will serve as a low permeability barrier from overlying liquids. It must be placed on a stable subgrade and may be used in conjunction with other geosynthetics to act as a composite liner or barrier system. Geomembrane typically has extensive QA/QC requirements for the manufacturer, installer, and the Owner's Representative.

8.1.3 DESCRIPTION AND DESIGN REQUIREMENTS

The geomembrane (a.k.a. Flexible Membrane Liner or FML) is designed to function as a liquid barrier for infiltrating storm water to minimize the impact of leachate on groundwater. FML is a stable material and retains its strength and hydraulic conductivity properties even after being subjected to strain from differential settling or being exposed to leachate. LLDPE is ideally suited for disposal facility liner and final cover systems. For this project, LLDPE will be used in the final cover system and the liner system.

8.1.4 SUBMITTALS

Submit the results of the manufacturer's quality control testing in accordance with the test requirements outlined in Table 4 as applicable to the Owner for review and verification that the reported test results meet with project specifications at least 10 days prior to delivery of the liner material to the job site.

Submit the results of all required prequalification testing as required in Section 4, including interface friction testing, to the Owner for review and verification that the reported test results meet with project specifications at least 10 days prior to delivery of the geomembrane material to the job site.

Upon delivery at the site, submit all roll identification and quality control certificates issued by the manufacturer to the on-site Owner representative. Rolls without proper identification will be rejected.

Submit the results of the quality control testing performed during the deployment of the geomembrane. This will include at a minimum:

- Trial welds
- Subgrade Acceptance Form
- Panel placement logs
- Panel seaming logs
- Non-destructive test results
- Destructive test results
- Repair logs
- Daily Panel Placement Drawings

8.1.5 Quality Assurance

Prior to delivery of the rolls of geomembrane, the Owner will verify that representative samples are removed and forwarded to a qualified independent testing laboratory for testing to verify conformance with the test methods and values presented in Table 4 as applicable.

8.1.6 Delivery Storage and Handling

Handle the geosynthetic materials in accordance with manufacturer's recommendations and utilize handling equipment on-site that poses minimal risk of damage to the material.

8.2 Products

8.2.1 Material Requirements

FML Barrier Liner for the Disposal Facility Liner: Utilize 50-mil textured LLDPE geomembrane for the disposal facility liner system containing no fillers or extenders. The minimum acceptable physical, mechanical, and hydraulic properties of the LLDPE-manufactured sheet are outlined in GRI-GM17. In particular, this project requires a 50-mil minimum thickness LLDPE geomembrane.

FML Barrier Liner for the Final Cover: Utilize 50-mil textured LLDPE geomembrane for the final cover system containing no fillers or extenders. The minimum acceptable physical, mechanical, and hydraulic properties of the LLDPE-manufactured sheet are outlined in GRI-GM17 and in Table 4.

It is the responsibility of the Contractor to verify that the most current version of GRI-GM17 is adhered to.

8.2.2 Source Quality Control

Quality Control testing for the geomembrane will be performed by the manufacturer on the representative samples of the proposed material to demonstrate and verify the materials meet minimum requirements outlined in GRI-GM17.

8.3 Execution

8.3.1 Construction and Installation

A daily Prepared Subgrade Acceptance form is to be signed and submitted by the installer to the Owner's representative.

Install the geomembrane above a stable subgrade after receipt of approval of the subgrade from the Owner.

Complete all geosynthetics field installation in accordance with the manufacturer's recommended installation procedures and the construction specifications as outlined in this Section and to the lines and grades shown on the construction drawings.

Ensure the method and equipment used to unroll the panels has the following characteristics:

- Does not cause scratches or crimps in the geomembrane and does not damage the supporting soil
- Minimizes wrinkles and has adequate temporary anchors (e.g., sandbags, tires) to prevent wind damage

For fusion seaming, a rub sheet may be required directly below each overlap of geomembrane to be seamed in order to prevent any moisture build-up between the sheets.

For extrusion seaming, geomembrane is to be cleaned using a disc grinder or equivalent prior to seaming.

Record all construction details for all deployed geomembrane on individual forms acceptable to the Owner's representative. This includes at a minimum:

- Panel placement logs
- Trial weld logs
- Panel seaming logs
- Repair logs
- Non-destructive and destructive test result logs

Prepare panel layout drawings (field sketches) of the deployed and tested geomembrane for review by the Owner's representative.

Complete the installation such that the geomembrane is smooth, without wrinkles, tears, or holes, and covers the total surface of the disposal facility liner and/or cap system. Do not leave tools, debris, or surplus materials on the surface.

8.3.1.1 Trial Welds

Verify seaming conditions and techniques are adequate by performing daily trial welds on representative pieces of geomembrane in accordance with the following procedures for all combinations of seamer and seaming equipment:

- Perform trial welds once in the morning and once in the afternoon, when operator/machine combinations change, and when an apparatus is turned off and restarted
- Perform additional trial welds when the liner temperature changes by 36°F or more since the previous trial weld was performed

A passing trial seam must be made at the frequency noted above for each seaming device and technician prior to performing production seaming.

8.3.1.2 Seam Geometry

Seam in accordance with the following specifications:

- Orient seams parallel to the line of maximum slope, i.e., oriented along, not across, the slope
- Minimize the number of seams in corners and odd-shaped geometric locations
- Where horizontal seams are necessary and acceptable to the Owner's representative, stagger seams a minimum distance of 10-feet between adjacent seams
- Do not allow horizontal seams to be within 5-feet of the toe of slopes or areas of potential stress concentration unless otherwise approved by the Owner's representative

8.3.1.3 Ambient Temperatures and Weather Considerations

Do not deploy geomembrane during any precipitation, fog, snow, in areas of ponded water, or in the presence of excessive winds.

Measure sheet temperature prior to seaming by placing a thermometer on the surface of the sheet.

Do not perform seaming where measured surface temperatures are below 32°F or above 104°F for extrusion welding and 140°F for fusion welding. Deviations from these temperature criteria may only occur when authorized by the Owner and with the concurrence of the Owner's representative.

8.3.2 FIELD QUALITY CONTROL

During deployment and seaming of the geomembrane, perform the following quality control tests and record the results for review and concurrence by the Owner's representative:

- Trial welds
- Non-destructive test results
- Destructive test results
- Repair logs

Perform non-destructive testing on 100 percent of field seams over their full length using a vacuum test unit (for extrusion seams only), air pressure test, or other acceptable method in accordance with industry accepted standards and in accordance with manufacturer's recommendations.

Complete non-destructive testing of the seams as the seaming work progresses and any required repairs in accordance with industry standards and in accordance with manufacturer's recommendations.

Ensure all field-testing equipment is calibrated in accordance with Table 8.

8.3.2.1 Air Channel Testing

Unless otherwise specified, air pressure testing of the seamed channel will include inflating the test channel, closing the valve, and observing initial pressure after approximate air temperature and pressure have stabilized. The initial pressure will be set appropriately as indicated in Tables 5, and the test will last for 5 minutes after reading the initial test pressure. If pressure loss exceeds the allowable specification in the Tables 5 or if the pressure does not stabilize, locate the faulty area and repair as needed. Flap welding is not an acceptable repair for a failing air channel test. For passing tests, at the end of the 5-minute period, cut the far end of the seam and note the resultant pressure drop.

8.3.2.2 Vacuum Box Testing

Unless otherwise specified, vacuum testing will be required on all extrusion welded seams. To vacuum test, turn on the vacuum pump to reduce the vacuum box to approximately 5 psi. They will apply liquid soap and water solution to the area to be tested, place the vacuum box over the area to be tested and apply sufficient downward pressure to "seat" the seal strip against the liner. Once a tight seal is created, observe the seam through the window for a period of not less than 10 seconds. If no bubbles appear after 10 seconds, proceed to the next segment of seam to be tested. Mark and repair areas failing the test with a cap strip or other acceptable method.

8.3.3 FIELD QUALITY ASSURANCE

The Owner's representative will confirm the roll identification corresponds to quality control certificates issued by the manufacturer.

The Owner will document observations during installation including damage, seaming logs, repair logs, test results, and conformance to specifications. Other items that will be noted include:

- The method and equipment used to unroll the panels does not cause scratches or crimps in the geomembrane and does not damage the supporting soil
- The method used to place the panels for minimization of wrinkles and temporary loading utilized to prevent wind damage

All field testing will be performed in the manner and at the frequency identified in Tables 5.

8.3.3.1 Destructive Testing

Unless an alternative frequency is indicated, the Owner's Representative will choose locations for cutting samples by the Contractor for all destructive seam tests at a frequency no less than one per every 1000-feet of seam completed by a particular seamer/apparatus combination.

Cut the samples as the seaming progresses in order to have passing test results before the geomembrane is covered by the overlying materials. The Owner's Representative will:

- Assign a number to each sample, and mark it accordingly
- Observe sample cutting
- Record the sample location on the layout drawing
- Record the reason for taking the sample at this location, if not taken due to statistical routine
- Observe and record all test results

The sample will be divided into three specimens: one for field testing by the Contractor, one for independent laboratory peel and shear testing, and one to the Owner for archive storage.

Test the field specimen with a properly calibrated tensiometer for peel and shear and verify it meets the minimum requirements presented in Table 5. If any field test sample fails to meet the minimum requirements, the Owner's Representative will determine locations for additional destruct samples for testing a minimum of 10-feet on either side of the failed test location continually bounding the failing test(s) until two bounding, passing tests are recorded. Repair the interval between the passing test locations with a cap strip and test via vacuum box.

If the result is passing, then the Owner's Representative will transport an additional specimen for laboratory testing. Peel and shear destructive seam sample testing will be performed with a calibrated tensiometer. At least five specimens will be tested. If a sample fails laboratory testing, then additional samples will be collected in the field similar to the field testing procedures.

Repair all holes in the geomembrane resulting from destructive seam sampling immediately.

8.3.3.2 Alternative Destructive Testing Sampling Frequency

As the project continues and data is accumulated, the sampling interval may be varied according to the procedure set forth in GRI GM14. Following this procedure will result in three possible situations:

- Good seaming with fewer rejected test results than the preset historic average can result in a sequential increase in the spacing interval, i.e., one per greater than 500-feet.
- Poor seaming with more rejected test results than the preset historic average can result in a sequential decrease in the spacing interval, i.e., one per less than 1000-feet.
- Average seaming with approximately the same test results as the preset historic average will result in the spacing interval remaining the same, i.e., one per 500-feet.

Alternative frequency testing will be implemented at the discretion of the Owner's representative.

9.0 GEOTEXTILE

9.1 GENERAL

9.1.1 SUMMARY

The following section discusses the specific QA/QC requirements for the testing and installation of this material. Geotextile will serve as a permeable, separative, and protective fabric layer between soil, aggregate, geosynthetic, and waste materials. Geotextiles typically have several QA/QC requirements for the manufacturer, installer, and the Owner.

9.1.2 DESCRIPTION AND DESIGN REQUIREMENTS

The geotextile is designed to separate dissimilar subsurface elements without retarding drainage through the materials. Geotextile will be used to wrap the aggregate surrounding the leachate collection pipes to prevent the infiltration of fines into the gravel pack. Geotextile will also be employed between subgrade soils and aggregate base course of the facility's access, perimeter, and haul roads, and as a protective barrier above the geomembrane liner in the sedimentation basins.

9.1.3 SUBMITTALS

Submit the results of the manufacturer's quality control testing in accordance with the test requirements outlined in Table 6 to the Owner for review and verification that the reported test results meet with project specifications at least 14 days prior to delivery of the geotextile material to the job site.

Submit the results of all required prequalification testing as required in Section 4, to the Owner for review and verification that the reported test results meet with project specifications at least 14 days prior to delivery of the geotextile material to the job site.

Upon delivery at the site, submit all roll identification and quality control certificates issued by the manufacturer to the Owner. Rolls without proper identification will be rejected.

9.1.4 QUALITY ASSURANCE

Prior to delivery of the rolls of geotextile, the Owner will verify that representative samples are removed and forwarded to a qualified testing laboratory for testing to verify conformance with the test methods and values presented in Table 7 as applicable.

9.1.5 DELIVERY STORAGE AND HANDLING

Handle the geotextile materials in accordance with manufacturer's recommendations and utilize handling equipment on-site that poses minimal risk of damage to the material.

9.2 PRODUCTS

9.2.1 MATERIAL REQUIREMENTS

Geotextile for Leachate Collection System: Utilize geotextile fabric for the leachate collection system that meets the minimum material properties outlined in Table 7.

9.2.2 SOURCE QUALITY CONTROL

Quality Control testing for the geotextile will be performed by the manufacturer on the representative samples of the proposed material to demonstrate and verify the materials meet minimum requirements outlined in Table 6.

9.3 EXECUTION

9.3.1 CONSTRUCTION AND INSTALLATION

Complete all geosynthetics field installation in accordance with the manufacturer's recommended installation procedures and the construction specifications as outlined in this Section and to the lines and grades shown on the construction drawings.

Complete the installation such that the geotextile is smooth, without wrinkles, tears, or holes. Do not leave tools, debris, or surplus materials on the surface. Installation will be performed in such a manner as to minimize damage and will comply with the following:

- After the wrapping has been removed, a geotextile will not be exposed to sunlight for more than the time specified by the manufacturer.
- On slopes, the geotextiles will be securely anchored and then rolled down the slope in such a manner as to continually keep the geotextile panel in tension.
- In the presence of wind, geotextiles will be weighted with sandbags or the equivalent. Sandbags will be installed during the placement and will remain until replaced with the appropriate overlying material.
- Sandbags will be filled with the fine-grained material and must be handled with care to prevent rupture.
- Geotextiles will be kept continually under tension to minimize the presence of wrinkles in the geotextile.
- Geotextiles will be cut using an approved geotextile cutter only (i.e., an upward cutting hook blade). If in place, special care must be taken to protect other materials from damage which could be caused by the cutting of the geotextiles.
- Precaution will be taken to prevent damage to the underlying layers during placement of the geotextile.

- During placement of geotextiles, care will be taken not to entrap stones, excessive dust, or moisture that could damage the geotextile, generate clogging of drains or filters, or hamper subsequent seaming.
- After installation, the entire surface of the geotextile will be examined, and harmful foreign objects, such as needles, will be removed.

9.3.1.1 Seams and Overlaps

Geotextiles will be continuously sewn using thread, which is as chemically resistant and UV resistant as the geotextile. Thread will be approved by the Owner. Alternately, geotextile may be joined by heat bonding. Spot sewing is not permitted, except for repairs. Geotextiles will be overlapped a minimum of 4-inches prior to seaming or heat bonding. If sewing of geotextile seams is to be used, a flat (prayer) seam, "J" seam, or "butterfly-folded" seam is recommended, and ensure the seam is a two-thread, double-lock stitch, or a double row of single-thread, chain stitch.

Horizontal seams on side slopes should be avoided. However, if horizontal seams are necessary, at least 100-feet will be maintained between horizontal seams of adjacent panels.

Complete the installation such that the geotextile is smooth, without wrinkles, tears, or holes. Do not leave tools, debris, or surplus materials on the surface.

9.3.1.2 Repairs

Any holes or tears in the geotextile will be repaired as follows:

- Holes in the geotextile will be patched with geotextile of the same unit weight;
- Sufficient overlap will be provided to ensure a suitable seam can be produced, that will not come apart and, when used as a filter, will contain soil; and
- Patches will be sewn and not heat bonded without the approval of the Project Manager.

Care will be taken to remove any soil or other material which may have penetrated the torn geotextile.

9.3.1.3 Placement of Materials on Geotextiles

Material will be placed on the geotextile in a manner that causes no damage to the geotextile or supporting materials. Low ground-pressure equipment will be used to place the overlying material. The equipment will be operated on the full depth of the layer. Equipment used for placing the overlying material will not be driven directly on the geotextile.

9.3.2 Field Quality Assurance

In addition to reviews of QC documentation, the Owner's representative will visually inspect installed geotextile for damage and conformance with the Specifications.

The Owner's representative will confirm the roll identification corresponds to quality control certificates issued by the manufacturer.

The Owner will document observations during installation including damage, seaming logs, repair logs, test results, and conformance to specifications.

10.0 HPDE Pipe

10.1 General

10.1.1 Summary

The following section discusses the specific QA/QC requirements for the testing and construction of this material. HDPE pipe and associated fittings will be used to construct the toe drain.

10.1.2 Description and Design Requirements

HDPE is a thermoplastic piping material that is suitable for both gravity and pressure applications.

10.1.3 Submittals

Submit the results of the manufacturer's quality control testing to the Owner for review and verification that the reported test results meet with project specifications at least 14 days prior to delivery of the HDPE pipe and appurtenances to the job site for each batch/lot of pipe.

Submit the results of all required prequalification testing as required in Section 4, to the Owner for review and verification that the reported test results meet with project specifications at least 14 days prior to delivery of the piping to the job site.

Submit the results of the required prequalification testing to the Owner as summarized in Table 3 for approval prior to obtaining pipe annulus aggregate material for use.

10.1.4 Delivery Storage and Handling

Handle the HDPE pipe and fittings with due care and utilize handling equipment on-site that poses minimal risk of damage to the material.

10.2 Products

10.2.1 Material Requirements

HDPE piping will consist of Standard Dimension Ratio (SDR) pipe, as specified in the project specifications. HDPE pipe fittings will be furnished by the manufacturer of the pipe with which they are used and will conform to the requirements of ASTM D3261 for standard fittings.

Pipe joints will be fusion welded, using only manufacturer-approved methods and equipment, unless noted otherwise in the construction drawings.

Pipe annulus aggregate requirements are contained in Table 3.

10.2.2 Source Quality Control

Quality Control testing for the HDPE pipe will be performed by the manufacturer on the representative samples of the proposed material to demonstrate and verify the materials meet the project specifications.

The Owner's representative will confirm the pipe batch/lot identification corresponds to quality control certificates issued by the manufacturer.

10.3 Execution

10.3.1 Construction and Installation

Complete all HDPE pipe installation in accordance with the manufacturer's recommended installation procedures and the construction specifications as outlined in this Section and to the lines and grades shown on the construction drawings.

10.3.1.1 Leachate Collection Pipe

Leachate collection piping will be perforated as detailed in the construction drawings. The leachate collection piping will be placed at locations shown; bedded in, and surrounded by a pipe annulus aggregate; and then wrapped with a non-woven geotextile. Non-perforated piping will be pressure tested prior to certification by the Owner's

10.3.1.2 Fusion Process for Joints

Pipe joints will be fusion welded, using only manufacturer-approved methods and equipment, and in conformance with the procedures outlined below, unless otherwise specified.

- Delivered pipes and fittings will be examined to verify that pipes and fittings are not broken, cracked, or contain otherwise damaged or unsatisfactory material. Prior to fusing, verify that the fusion surface area is clean and free of moisture, dust, dirt, debris of any kind, and foreign material.
- Fusion of the HDPE joints will be performed at temperatures above 32°F, unless otherwise authorized in writing by the Owner's Representative.

10.3.1.3 Pressure Testing of Joints

The joints of non-perforated HDPE pipes will be tested using the pressure test procedures given in ASTM C924. Other non-destructive test methods may be used only when approved by the Owner. Test pipe in-place after installation and prior to backfilling.

Pipe and fused joint leaks identified during testing will be repaired by cutting out the leaking area and refusing the pipe. After all leaks are repaired, a retest will be performed.

A final test will be performed of the completed pipeline using the test procedure in ASTM C924. The completed system when tested should be in its proper trench location and allowed time to reach constant and/or ambient temperature before initiating the test.

10.3.2 Field Quality Assurance

During installation of the HDPE pipe, perform the following quality control tests and record the results for review and concurrence by the Owner's representative:

- Non-destructive pressure test results
- Pipe repair logs

The Owner will document observations during installation including damage, repair logs, test results, and conformance to specifications. The method and equipment used to fuse pipe joints will also be noted.

11.0 Surface Water Controls Structures

11.1 General

11.1.1 Summary

The following section discusses the specific QA/QC requirements for the construction of surface water control structures. Surface water control structures will be constructed to manage surface water runoff from the disposal facility.

11.1.2 Description and Design Requirements

Surface water control structures include channels, benches, ditches, letdowns, culverts, and catch basins. These structures are designed to manage surface water at the site. Precast concrete surface water control structures may also be designed to meet specified traffic loading requirements.

11.1.3 Submittals

Submit the results of the manufacturer's quality control testing to the Owner for review and verification that the reported test results meet with project specifications at least 10 days prior to delivery of the erosion control matting/turf control matting (ECM/TCM) and culvert pipe to the job site.

Submit the results of the required prequalification testing for riprap material to the Owner as summarized in Table 3 prior to obtaining riprap material for use.

Submit shop drawings and/or manufacturer's certification demonstrating the ability of precast concrete surface water control structures to meet traffic loading requirements as required by the project specifications or construction drawings.

11.1.4 Delivery Storage and Handling

Handle the ECM/TCM, precast concrete structures, and culvert pipe in accordance with manufacturer's recommendations and utilize handling equipment on-site that poses minimal risk of damage to the material.

11.2 Products

11.2.1 Material Requirements

Riprap materials will conform to the requirements of Section 703 of the KYTC "Standard Specifications for Road and Bridge Construction" for the riprap material classification specified in the project specifications or construction drawings.

11.2.2 Source Quality Control

Perform additional field or laboratory tests as often as is necessary to document the riprap material continues to meet the prequalification specifications contained in the Material Requirements section above.

11.3 Execution

11.3.1 Construction and Installation

Excavate channels to the lines and grades shown on the construction drawings. Install ECM/TCM in accordance with the manufacturer's recommended installation procedures and the construction specifications.

11.3.2 Field Quality Assurance

In addition to reviews of QC documentation, the Owner's representative will visually inspect installed surface water control structures for damage and conformance with the Specifications.

The Owner's representative will verify that proper burial depth and slope is maintained on pipe installed as part of the surface water control structures.

12.0 Cast-In-Place Concrete

12.1 General

Cast-in-place concrete shall be utilized in the areas shown on the Plans for Construction in accordance with the Technical Specifications.

12.2 Quality Control Requirements

The Contractor shall submit documentation regarding the acceptability of the subject materials for the project to the Owner. Required submittals are specified in the Technical Specifications and presented in Appendix B of this plan.

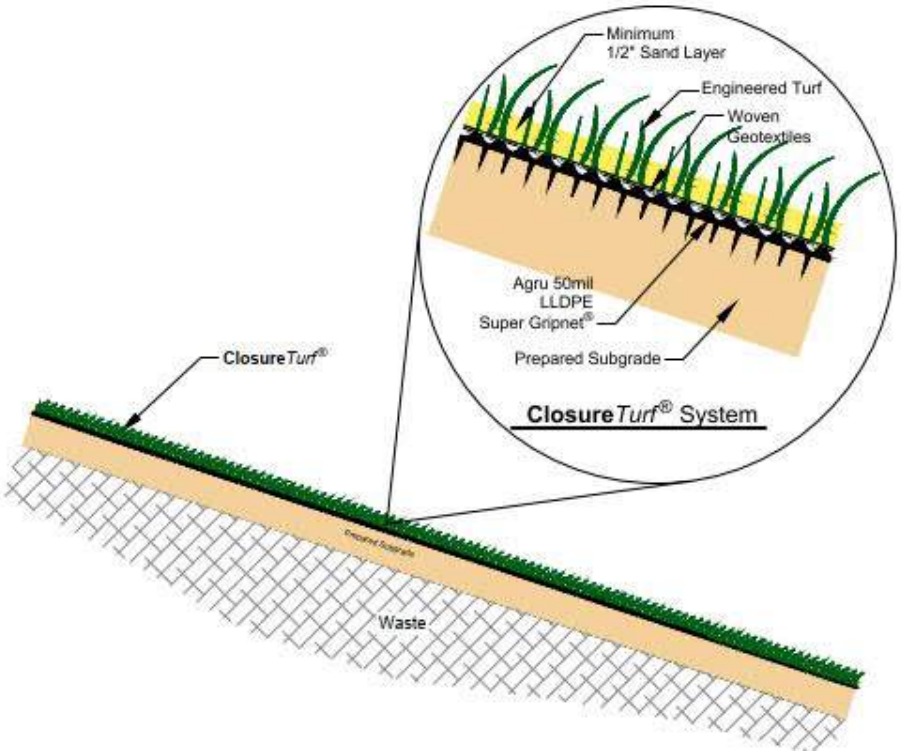
Standard tests of the material and concrete shall be performed as required by the Technical Specifications and at frequencies shown in the testing schedule in Table 9. Retests due to non-conformance of the materials shall be performed, as approved by the Owner.

Must administer epoxy coating and conduct hydrostatic leak test.

13.0 CLOSURETURF

13.1 GENERAL

ClosureTurf system consists of engineered synthetic turf with a sand layer on top of geotextile and studded geomembrane deployed above the prepared subgrade.



13.2 REQUIREMENTS

Equipment used to install Closure Turf synthetic components shall be as per the manufacturer's recommendations so as to not cause damage to any of the layer components. Equipment to be used may include tracked equipment such as a skid steer, forklift or other type of low ground pressure equipment.

See Appendix B for all ClosureTurf requirements.

TABLES

Table 1A. Laboratory Test Methods for the Evaluation of Aggregate

COMMON TEST NAME	PARAMETER DEFINED	STANDARD METHOD
Permeability: Constant Head	Permeability (Hydraulic Conductivity) of Aggregates	ASTM D2434
Carbonate Content	Carbonate Content of Aggregate	ASTM D3042

Notes:

1) Not all tests are required for this site; refer to Table 3 in the CQA Plan.
2) Latest version of the applicable ASTM International or USDA testing standards will be used when conducting tests.

Table 1B. Field Test Methods for the Evaluation of Soil and Aggregate

COMMON TEST NAME	PARAMETER DEFINED	STANDARD METHOD
Visual Classification	Maximum Particle Size, General Material Characteristics	ASTM D2488
USDA Classification	Classification of Ability to Support Vegetation	USDA Method
Nuclear Methods	In-Place Density and Moisture Content	ASTM D6938
Lift Depth Check	Thickness of Placed Soils or Aggregates	Visual Confirmation

Notes:

1) Not all tests are required for this site; refer to Table 3 in the CQA Plan.

2) Latest version of the applicable ASTM International or USDA testing standards will be used when conducting tests.

Table 2. Minimum Requirements and Test Frequencies for Shear Strength Prequalification

Item/Interface Description	Material Preparation	Required Tests	Material Selection	Frequency	Specification [1], [2]			Basis For Test	Certification
Baseliner Floor System (slopes <10%)									
					Peak Secant Angle (degrees)	Normal Stress (psf)	Peak Shear Stress (psf)		
Interim Soil Cover/Textured LLDPE	Soil is to be compacted to moisture and density expected during construction. All geosynthetics interfaces to be oriented same side to same side as in the in the field.	Interface Shear Strength ASTM D5321 over range of normal stresses anticipated	Representative samples of geosynthetics and specific soils/CCR in interim soil cover	Minimum twice prior to initial construction. More if additional soil/CCR variations are encountered in stripping the vegetation from the interim soil cover.	15.5	2,000	555	Deep seated translational failure analysis of final waste slopes	Results evaluated and approved as having met applicable specifications established by the slope stability analysis
						5,000	1387		
						10,000	2773		
						20,000	5546		

(1) In situations where a conformance test results falls below the specified minimum, review Figures 1 through 3 following these tables that depict acceptable combinations ϕ and c where c is greater than 0 for each loading scenario. In addition, the particular slope stability calculation can be repeated to determine if additional non-linear analyses and/or reasonable changes in assumptions show the material to be acceptable.

(2) Minimum peak shear strengths are provided in both friction angle and shear stress at specified normal loads. Shear stress (τ) is calculated using the equation $\tau = c + \sigma\tan\phi$ where c = cohesion or adhesion and σ = normal force. Exceeding either the required friction angle with cohesion/adhesion = 0 or the minimum shear stress at the required normal loads is acceptable. Minimum shear strength values given in the table are representative of expected mathematical results given the various normal stresses in the table. However, the minimum required shear strength is represented by the envelope developed utilizing the combination of all the points resulting from the laboratory testing. In some cases where the laboratory results are very close to the minimum required values, not all the minimum values are required to be exceeded as long as the overall envelope exceeds the minimum shear strength requirements over the range of normal stresses exhibited in the field. Engineering judgment must be utilized in these instances.

(3) The strength of these materials has been conservatively assumed in the slope stability analysis. These materials should be tested once prior to initial construction to verify the minimum assumed strength parameters are exceeded. Subsequent construction projects should have a geotechnical engineer verify the material characteristics are similar to those tested and verified as passing results. If different materials or a different borrow source are utilized, additional testing should be considered.

(4) The maximum allowable strain rate for geosynthetic to geosynthetic and geosynthetic to free-draining aggregate material interfaces shall be 0.04 inches per minute. The maximum allowable strain rate for geosynthetic to soil interfaces shall be 0.004 inches per minute.

(5) The minimum residual value should be attained and maintained at or prior to deformation equaling 1.5 inches to meet the acceptable maximum deformation requirements for the cover system during the design earthquake. If this value is not met, the deformation analysis should be reevaluated by a qualified geotechnical engineer to determine if the laboratory results for residual strength are acceptable

Table 3. Minimum Requirements and Test Frequencies for Soil and Aggregate Materials

Component	Required Test	Minimum Frequency	Sample Size[1]	Acceptance Criteria
Undercut Subgrade Performance Testing [3]	Visual Observation	As required	N/A	Final surface: firm, smooth, and uniform.
	Lift Depth Check	As required	N/A	6 to 8 in compacted lift.
	Visual Observation	As required	N/A	Compacted with dozer tracks, sheep foot, or smooth drum roller.
Prepared Turf Subgrade Performance Testing [3]	Visual Inspection: The prepared subgrade shall be visually inspected by the installer and the owner/engineer.	Continuous.	N/A	Visual inspection, and approved subgrade acceptance form. Final surface shall be firm, smooth, and uniform, and free from debris. Rutting in excess of 3 inches shall be repaired to the satisfaction of the installer and owner's CQA representative.
Pipe Annulus Aggregate – Washed River Gravel Prequalification Conformance Testing [2]	Sieve Analysis (ASTM C136)	1 per source & 1 per 5,000 yd^3	5-10 lb	Meet Specifications for KYTC No. 57 gravel 100% passing 1-1/2 in. sieve; 95%-100% passing 1 in. sieve; 25% -60% passing 1/2 in sieve; 0%-10% passing #4 sieve; 0-5% passing #8 sieve.
Pipe Annulus Aggregate – Washed River Gravel Prequalification Conformance Testing [2]	Insoluble Residue Carbonate Test (ASTM D3042)	1 per source & 1 per 20,000 CY	Varies	<5% loss, by weight
Pipe Annulus Aggregate – Washed River Gravel Performance Testing [3]	Visual Observation	As required	N/A	Pipe satisfactorily supported by aggregate bedding haunched to pipe springline prior to backfill with aggregate.
Sand Infill Prequalification Conformance Testing [2]	Sieve Analysis (ASTM C136)	1 per source & 1 per 175 yd^3	50 lb	Refer to acceptable gradation curve provided in Graph below.
	ASTM C 1252 / AASHTO T 304, Standard Test Methods for Uncompacted Void Content of Fine Aggregate Method A.	1 per source & 1 per 2,000 yd^3		≥ 40%
	ASTM C 128 / AASHTO T 84, Standard Test Method for Relative Density (Specific Gravity) and Absorption of Fine Aggregate.	1 per source & 1 per 2,000 yd^3		≥ 2.40
	Constant Head Permeability	1 per source & 1 per 5,000 yd^3	50 lb	≥ $4.1x10^{-3}$ cm/sec
Riprap Prequalification Conformance Testing [2]	Gradation Analysis (ASTM D5519)	1 per source per riprap gradation	N/A	Quarry Submittal on gradation must meet specifications for KYTC "Standard Specifications for Road and Bridge Construction" Section 703

(1) In general, where the symbol "N/A" (not applicable) is used, the test is performed on in-place materials.
(2) Conformance testing is performed on borrow sources to ensure the minimum required values are met and the material remains consistent.
(3) Performance testing is performed on materials after placement is complete to ensure that the lift or layer meets design requirements.

Sand Infill Grain Size Distribution

GEOSYNTHETICS

agru
The Plastics Experts.

Super Gripnet® Liner

LINEAR LOW DENSITY POLYETHYLENE

AGRU America's structured geomembranes are manufactured on state-of-the-art manufacturing equipment using the flat die calender manufacturing process, a method that produces a more consistent core thickness than other processes, such as the blown film extrusion process. AGRU uses only the highest-grade HDPE and LLDPE resins manufactured in North America.

PRODUCT DATA

Property	Test Method	Frequency	Minimum Average Values
Thickness (nominal), mil (mm)	ASTM D5994	Per Roll	50 (1.25)
Thickness (min avg), mil (mm)			47.5 (1.19)
Thickness (min 8 of 10), mil (mm)			45 (1.12)
Thickness (lowest individual), mil (mm)			42.5 (1.06)
Drainage Stud Height, mil (mm)	ASTM D7466	2nd Roll	130 (3.3)
Friction Spike Height, mil (mm)	ASTM D7466	2nd Roll	175 (4.45)
Density g/cc, maximum	ASTM D792, Method B	200,000 lb	0.939
Tensile Properties (both directions) Strength @ Break, lbs/in width (N/mm) Elongation @ Break, % (GL=2.0 in)	ASTM D6693, Type IV 2 in/minute	20,000 lb	105 (18.4) 300
Tear Resistance, lbs. (N)	ASTM D1004	45,000 lb	30 (133)
Puncture Resistance, lbs. (N)	ASTM D4833	45,000 lb	55 (245)
Carbon Black Content, % (range)	ASTM D4218	20,000 lb	2-3
Carbon Black Dispersion (Category)	ASTM D5596	45,000 lb	Only near spherical agglomerates, 10 views Cat. 1 or 2
Oxidative Induction Time, minutes	ASTM D3895, 200°C, 1 atm O2	200,000 lb	>140
Transmissivity, m²/sec	ASTM D4716	Periodic	4 x 10⁻⁷

AGRU America's geomembranes are certified to pass Low Temp. Brittleness via ASTM D746 (-60°C), Dimensional Stability via ASTM D1204 (±2% @ 100°C). Oven Aging and UV Resistance are tested per GRI GM 17. These product specifications meet or exceed GRI GM 17. Transmissivity at a temp. of 21°C, gradient of 0.1 and 5 load of 10,000 psf, seating time 15 min. between steel plates.

SUPPLY INFORMATION (STANDARD ROLL DIMENSIONS)

THICKNESS mil	THICKNESS mm	WIDTH ft	WIDTH m	LENGTH ft	LENGTH m	AREA (APPROX.) ft²	AREA (APPROX.) m²
50	1.25	23	7	500	152	11,500	1,068
60	1.5	23	7	500	152	11,500	1,068
80	2.0	23	7	300	91.4	6,900	640
100	2.5	23	7	300	91.4	6,900	640

Note:

Average roll weights: 5,000 lbs (2,268 kg) for 50 and 60 mil and 4,000 lbs (1,814 kg) for other thicknesses. All rolls are supplied with two strips. Rolls are wound on a 6" core. Special length available upon request. Roll length and width have a tolerance of ±1%. The weight values may change due to project specifications (i.e. absolute minimum thickness or special length or shipping requirements (i.e. international containerized shipments).

(1) Minimum of ten readings must be equal to or greater than the specified thickness.

(2) Or as required to meet the interface shear requirements for the project. See Section 4 of the CQA Plan. Minimum of ten readings must average specified height. Eight of the readings must be ≥ 12 mils, and the lowest reading must be ≥ 8 mils. No visible variation across the width of the roll will be allowed.

(3) Carbon dispersion for 10 different views: 9 of 10 views will be Category 1 or 2 with one view allowed in Category 3.

(4) Manufacturer's Quality Control testing will be performed at a frequency of one test per every 50,000 ft^2 or one test per resin lot, whichever is more frequent. Thickness testing will be performed on each roll.

(5) Asperity Height measurements will be performed on every roll, alternating between measurements for top of sheet and bottom of sheet.

Table 5. Required 50-Mil Textured LLDPE Seam Properties

PARAMETER	TEST METHOD	TEST FREQUENCY		ACCEPTANCE CRITERIA FOR 50-MIL LLDPE (2)
		QC Testing	QA Testing	
Seam Shear Strength (PPI)	ASTM D 6392	1 per welder per machine prior to each seaming period	1 every 1000 feet of seam length	75 ppi and all tests film tear bond
Seam Peel Strength (PPI)	ASTM D 6392	1 per welder per machine prior to each seaming period	1 every 1000 feet of seam length	63 (wedge) and 57 (extrusion) ppi and all tests film tear bond
Air Pressure	GRI GM6	N/A	All fusion welds	Pressure to 30 to 35 psi for 5 minutes, ≤ 3 psi loss, note pres-sure drop when far seam is cut
Vacuum Box Testing	ASTM D 5641	N/A	All extrusion welds	Examine weld for 10 seconds through window of vacuum box at min. 3 psi

(1) For Shear Testing of both fusion and extrusion welds, the strength of 4 out of 5 specimens should meet or exceed the given value. The 5th can be as low as 80% of the tested value. Required laboratory seam testing will be performed by a geosynthetics testing laboratory at a frequency of one test per 500 linear feet of seam constructed for both extrusion and fusion welding equipment unless otherwise directed by the Owner's Representative.

(2) For Peel Testing of fusion welds, the strength of 4 out of 5 specimens should meet or exceed the given value. The fifth can be as low as 80% of the tested value. All specimens will fail due to non-film tear bond or with greater than 25% incursion of the weld (peel).

(3) For Peel Testing of extrusion welds, 1 out of 5 specimens may either achieve <52 lb/in. but be ≥41.6 lb/in. or exhibit greater than 25% incursion of the weld (peel). The remaining four specimens must meet the specified strength and have a maximum of 25% incursion of the weld (peel).

(4) For Air Channel Testing of fusion welds, specimen must maintain pressure for 5 minutes with no less than 3 psi pressure drop. Note pressure drop when far seam is cut.

(5) For Vacuum Box Testing of extrusion welds, examine weld for 10 seconds at the required test pressure through the vacuum box window for evidence of leaks.

Table 6. Required Properties For Nonwoven Geotextiles – Manufacturing Quality Control

Material Property	Value[(1)]	Units	Test Method	Manufacturer's Frequency
10 oz/sy Nonwoven Geotextile

Table 8. Calibration Of Testing Equipment

Equipment	Required Test	Minimum Frequency	Acceptance Criteria
Nuclear Density Gauge	Radioactive Source Wipe Testing and Systems Electronics Check	Annually by Manufacturer or Specialty Testing firm qualified to inspect and calibrate nuclear source equipment	Certificate of Calibration and Safety by Testing Firm
Tensiometer	Tensile strength calibration to standard	Prior to arrival to project site. Tensiometer to be field verified at the discretion of the Engineer	+/- 3 psi
Air Pressure Gauges	Pressure in psi compared to standard	Prior to arrival to project site or documentation that the product is new	+/- 1 psi
Other	As Determined by the Engineer	As Recommended by the Manufacturer, or Required by State Auditor of Measurement Devices	As Guaranteed by the Manufacturer

Table 9. Minimum Requirements for Cast-In-Place Concrete

Material	Requirements	Minimum Frequency
Formwork	Supplier certification and all other available documentation to demonstrate that the supplied material meets project requirements.	1 / supplier / product
Concrete Materials	Supplier certification and all other available documentation to demonstrate that the supplied material meets project requirements.	1 / supplier / product
Design Mix	Supplier certification and all other available documentation to demonstrate that the supplied material meets project requirements.	1 / supplier / product
Steel Reinforcing Bar	Shop Drawings and supplier certification and all other available documentation to demonstrate that the supplied material meets project requirements.	1 / supplier / product
Mill Tests	Three copies of each test report; bars shall be properly tagged so as to permit identification of the heat number shown on the mill test report for any and all steel delivered to the Project Site	1 / supplier / product / 15 tons (or less) delivered
Ready-Mix Delivery Slips	Contractor shall keep a record of time and place of each batch of concrete, together with ready-mix delivery slips (batch tickets) certifying contents and proportions of each truck load delivered to the site. Records shall be available for inspection by the CQC Manager upon request.	Available upon Request, and submitted at completion of the work

PARAMETER	TEST METHOD	TEST FREQUENCY		ACCEPTANCE CRITERIA FOR 50-MIL LLDPE (2)
		QC Testing	QA Testing	
Thickness (mils)	ASTM D-5994	Each roll	1 per 100,000 sf	47.5 minimum average 42.5 minimum individual 45 minimum for at least 8 of 10 individual
Drainage Stud/Asperity Height (mils)	ASTM D7466	Every 2nd Roll (3)	1 per 100,000 sf	130 minimum average
Density (g/cm^3)	ASTM D1505/ D792	1 per 200,000 lb.	1 per 100,000 sf	0.939 minimum
Strength at Break (ppi) Elongation at Break (%)	ASTM D 6693 ASTM D 6693	1 per 20,000 lb 1 per 20,000 lb	1 per 100,000 sf 1 per 100,000 sf	≥ 105 ≥ 250%
Carbon Black Content	ASTM D 4218	1 per 45,000 lb.	1 per 100,000 sf	2.0% to 3.0%
Carbon Black Dispersion	ASTM D 5596	1 per 45,000 lb.	1 per 100,000 sf	9 in Category 1 or 2 and 1 in Category 3
Oxidative Induction Time (OIT)	ASTM D3895 or D5885	1 per 200,000 lb.	none	100 min. (ASTM D3895) or 400 min. (ASTM D5885)
Oven Aging at 85°C	ASTM D5721	Per each formulation	none	35% (standard) or 60% (high pressure)
UV Resistance	ASTM D5885	Per each formulation	none	35%
Pre-Construction Interface Testing	ASTM D 6243-98	Twice initially, once per construction event thereafter	Not required	Per Minimum Required Sheer Strength for Veneer Stability(3,4)See Attachment Figures
Transmissivity (8) (@ 240 psf normal load, gradient = 0.33)	ASTM D 4716	See Note 7	1 per 1,000,000 sq. ft.	5 x 10^{-4} m^2/sec

1) Acceptance criteria from GRI GM17 and GRI GM19 unless otherwise noted.
2) Alternate the measurement side for double sided textured sheet.
3) Tests will be performed on the entire liner system cross-section and over the range of normal stresses planned for application during shearing.
4) Interface Shear to be performed by the Owner for approval for use of the Contractor's proposed product. Interface Shear testing will be performed on the sample with the lowest asperity height from the QC testing, andthe lowest asperity height from the QA testing.
5) QC Testing to be provided by the manufacturer at the frequency noted.
6) QA Testing to be provided by the Owner.
7) At the manufacturer's recommended frequency unless noted otherwise.
8) Transmissivity shall be measured under the same boundary conditions (soil/geosynthetics) as those to beconstructed.

ClosureTurf

This ClosureTurf® Specification document has been prepared to provide the Owner, Design Engineer, Construction Quality Assurance Professional of Record, and the Contractor / Installer with a general guidance specification. All information, recommendations and suggestions appearing in this specification concerning the use of our products are based upon experience, tests and data believed to be reliable; however, this information should not be used or relied upon for any specific application without independent professional examination and verification of its accuracy, suitability and applicability. The independent professional shall edit this document to suit the site specific project design criteria. Since the actual use by others is beyond our control, no guarantee or warranty of any kind, expressed or implied, is made by Watershed Geosynthetics LLC as to the effects of such use or the results to be obtained, nor does Watershed Geosynthetics LLC assume any liability in connection herewith. Any statement made herein may not be absolutely complete since additional information may be necessary or desirable when particular or exceptional conditions or circumstances exist or because of applicable laws or government regulations. ClosureTurf® is a U.S. registered trademark which designates a product from Watershed Geosynthetics LLC. This product is the subject of issued U.S. and foreign patents and/or pending U.S. and foreign patent applications. Nothing herein is to be construed as permission to grant license or as a recommendation to infringe any patent.

SECTION 01 42 00

ClosureTurf® QUALITY REQUIREMENTS REFERENCES AND DEFINITIONS

PART 1: GENERAL

1.01 SUMMARY

A. Section Includes:

References and Definitions related to the ClosureTurf® product.

1.02 RELATED SECTIONS

Section 31 23 13 - Subgrade preparation (Upper 6 inches of subgrade only)

Section 01 42 00 - References and Definitions

Section 01 60 00 - ClosureTurf® Product Specification

Section 01 60 00 - ClosureTurf® MicroDrain® Product Specification

Section 01 60 01 - ClosureTurf® MicroSpike® Product Specification

Section 01 73 19 - ClosureTurf® Installation Specification

Section 31 05 16 - ClosureTurf® Sand Infill Specification

Section 03 49 01 - Alternate HydroBinder® Infill Specification

Section 23 51 23 - ClosureTurf® HDPE Pressure Relief Valve Specification

GRI-GM11– Accelerated Weathering of Geomembranes Using a Fluorescent UVA Device.

GRI-GM12 –Measurement of the Asperity Height of Textured Geomembranes Using a Depth Gage

GRI-GM17 – Test Methods, Test Properties, and Testing Frequency and for Linear Low Density Polyethylene (LLDPE) Smooth and Textured Geomembranes

GRI-GM19 - Seam Strength and Related Properties of Thermally Bonded Polyolefin Geomembranes

1.04 DEFINITIONS

A. Definitions as related to the ClosureTurf® Product and the Construction Quality Assurance (CQA) Plan definitions for the product. Whenever the terms listed below are used, the intent and meaning will be interpreted as indicated.

Acclimation

Physiological/thermal adjustment. Required in the geomembrane deployment process.

ArmorFill®

Armor-Fill® Liquid Emulsion is a proprietary Polymer Emulsion product used to bind the ASTM-C33 sand infill component of the ClosureTurf® System.

ASTM

ASTM International, known until 2001 as the American Society for Testing and Materials, is an international standards organization that develops and publishes voluntary consensus technical standards for a wide range of materials, products, systems, and services.

ClosureTurf®

A patented 4 component system consisting of a Watershed Geosynthetics specific Gas Management System (if applicable), a Structured Geomembrane (LLDPE or HDPE), an Engineered Turf, and a specified grade of sand infill (or alternatively a HydroBinder® infill material).

Construction Quality Assurance (CQA)

Construction Quality Assurance includes but is not limited to observations and documentation of materials and workmanship necessary to show that a particular project is being constructed according to site-specific specifications and within regulatory guidelines.

Construction Quality Assurance (CQA) Personnel

Construction Quality Assurance (CQA) personnel are representatives of the Professional of Record (POR) who work under direct supervision of the POR. The CQA personnel are responsible for quality assurance monitoring, applicable conformance sampling and performing onsite tests and observations.

Construction Quality Assurance Professional of Record (POR)

The POR is an authorized representative of the Owner and has overall responsibility for CQA efforts and to confirm the project was constructed in general accordance with site-specific specifications approved by the regulatory authority and contract documents. The POR must be licensed as a Professional Engineer in the State the project is located and experienced in geosynthetics.

Construction Quality Control (CQC) Personnel

CQC Personnel are representatives of the Geosynthetics Installer who work under direct supervision of the Geosynthetics Installer. The Geosynthetics Installers' CQC Personnel are responsible for construction quality control, applicable conformance sampling and performing onsite tests and observations.

Contract Documents

Written, printed, or electronic matter that provides information or evidence that serves as an official record and are issued by the owner or operator. The documents include bidding requirements that include but are not limited to, contract forms, contract conditions, contract specifications, CQA plan, contract drawings, addenda, and contract modifications.

Contract Specifications

The requirements which are to be followed in the construction of the ClosureTurf® System. The standard specifications, supplemental specifications, special provisions, and all written or printed agreements and instructions that pertain to the method and manner of performing the work.

Contractor

One that agrees to furnish materials or perform services at a specified price, especially for construction work.

Design Engineer

An individual licensed to practice as a Professional Engineer or a Professional Service Firm that is responsible for the preparation of the project construction drawings and specifications.

Earthwork

A general engineering term relating to the relocation and utilization of soil during the process of construction.

Engineered Turf

A component of the ClosureTurf® System. A synthetic structured material consisting of one or more geotextiles tufted with polyethylene yarns that resemble grass blades.

Final Cover System Evaluation Report (FCSER)

Upon substantial completion of closure activities, the POR is responsible for the documentation of construction activities relating to the project, and any other inspections or verifications required by the regulatory authority. The FCSER will be signed and stamped by the POR and include documentation necessary for certification closure.

Fish Mouth

A semi-conical opening of the seam that is formed by an edge wrinkle in one sheet of the geomembrane component.

Geomembrane

A synthetic lining material that is a component of the ClosureTurf® System. Used as the primary barrier to infiltration and exfiltration of covered materials.

GSI

Geosynthetic Institute

475 Kedron Avenue

Folsom, PA 19033-1208 USA

TEL (610) 522-8440

FAX (610) 522-8441

HydroTurf®

A patented 3 component system consisting of a Structured Geomembrane Liner, a specialized Engineered Turf, and HydroBinder® infill material.

HydroBinder®

A proprietary pozzolanic infill utilized where higher surface water velocities may occur as well as in anchor trenches where specified.

Geosynthetics Contractor / Installer

The entity responsible for geosynthetic installation.

HDPE

High density polyethylene is a polyolefin material used to produce geomembranes.

Independent Testing Laboratory

An organization, person, or company that tests products and materials, etc. according to agreed requirements. The entity shall be independent of ownership or control by the Owner or any party to the construction of the final cover or the manufacturer of the final cover products used. The entity shall also have proper legal authority where required to issue opinions and document the results of tests requested by the Owner.

Installation Supervisor

The person on-site who works for the Geosynthetics Installer and is in charge of the Geosynthetics Personnel and following the site specifications for the installation of the geosynthetics.

LLDPE

Linear low density polyethylene is a polyolefin material used to produce geomembranes.

Manufacturing Quality Control (MQC)

A planned system of inspection and verification to ensure the quality of the final product.

Nonconformance

A deficiency in characteristics, documentation, or procedures that render the quality of an item or activity unacceptable or indeterminate. Examples of non-conformances include, but are not limited to, physical defects, test failures, and inadequate documentation.

Operator

The entity in control and responsible for the facility.

Owner

The entity that owns facility and land.

Owner's or Operators Representative

An official representative of the Owner or Operator responsible for planning, organizing, and controlling construction activities.

Panel

A general reference to a unit area of either the Structured Geomembrane (LLDPE or HDPE), or the Engineered Turf component of the ClosureTurf® System.

Quality Assurance

A planned and systematic pattern of procedures and documentation to ensure that items of work or services meet the requirements of the contract documents.

Quality Control

These actions provide a means to measure and regulate the characteristics of an

item or service to comply with the requirements of the contract documents.

Relief Valve

A mechanical device used specifically to relieve gas buildup pressure underneath the ClosureTurf® system.

Representative Sample

(With respect to geomembrane destructive testing) - A random specimen of either the Structured Geomembrane (LLDPE or HDPE) or the Engineered Turf component consisting of 1 or more cut pieces (commonly referred to as coupons) from the same rectangular portion of material, oriented along a seam that is removed for field or laboratory testing purposes.

Ripple

Smaller in nature than a wrinkle. A result of thermal/or manufacturing that cannot be folded over.

Snapping

A manual method to an open ended seam to remove tenting as a result of the welding of the geomembrane seams.

Spike

A systematic design for interface friction located on the bottom of the Super Gripnet®.

Specimen

(With respect to geomembrane destructive testing) - A specimen is the individual test strip (sometimes called coupon) from a sample location. A sample location can consist of many specimens.

Studs

A systematic design for drainage located on the top side of the Super Gripnet®.

Surficial Collection Foot

A manufactured device utilized specifically for collection of gas beneath the Super Gripnet®.

Surficial Strip

A strip of Super Gripnet® used for gas conveyance below the ClosureTurf® system.

Tenting

A vertical ridge that is caused by wedge welding geomembrane.

Wrinkle

A portion of the geomembrane that does not lay relatively flat and is not a result of subgrade irregularity and which can be folded over.

PART 2: PRODUCTS:

Not Used.

PART 3: EXECUTION:

Not Used.

END OF SECTION

This ClosureTurf® Specification document has been prepared to provide the Owner, Design Engineer, Construction Quality Assurance Professional of Record, and the Contractor / Installer with a general guidance specification. All information, recommendations and suggestions appearing in this specification concerning the use of our products are based upon experience, tests and data believed to be reliable; however, this information should not be used or relied upon for any specific application without independent professional examination and verification of its accuracy, suitability and applicability. The independent professional shall edit this document to suit the site specific project design criteria. Since the actual use by others is beyond our control, no guarantee or warranty of any kind, expressed or implied, is made by Watershed Geosynthetics LLC as to the effects of such use or the results to be obtained, nor does Watershed Geosynthetics LLC assume any liability in connection herewith. Any statement made herein may not be absolutely complete since additional information may be necessary or desirable when particular or exceptional conditions or circumstances exist or because of applicable laws or government regulations. ClosureTurf® is a U.S. registered trademark which designates a product from Watershed Geosynthetics LLC. This product is the subject of issued U.S. and foreign patents and/or pending U.S. and foreign patent applications. Nothing herein is to be construed as permission to grant license or as a recommendation to infringe any patent.

SECTION 01 60 00

ClosureTurf® Super Gripnet® PRODUCT SPECIFICATION

PART 1: GENERAL

1.01 SUMMARY

A. Section Includes:

Product specifications for ClosureTurf® utilizing the SuperGripnet geomembrane component.

1.02 RELATED SECTIONS

Section 31 23 13 - Subgrade preparation (Upper 6 inches of subgrade only)

Section 01 42 00 - References and Definitions

Section 31 05 16 - ClosureTurf® Sand Infill Specification

Section 03 49 01 - Alternate HydroBinder® Infill Specification

Section 23 51 23 - ClosureTurf® HDPE Pressure Relief Valve Specification

1.03 REFERENCES

A. See Section 01 42 00 – References and Definitions

PART 2: PRODUCTS:

2.01 MANUFACTURERS

A. ClosureTurf® is a patented system and is the intellectual property of Watershed Geosynthetics, LLC.

2.02 DESCRIPTION

A. ClosureTurf® is a 4 component system consisting of a Structured Geomembrane, an Engineered Turf, a Specified Sand or HydroBinder® Infill, and a Gas Pressure Relief System (if applicable).

1. Structured Geomembrane – See ClosureTurf w/ Super Gripnet® Product Data Sheet.
2. Engineered Turf - See ClosureTurf w/ Super Gripnet Product Data Sheet
3. Specified Infill – See Section 31 05 16
    a. Where required, the alternate to the specified sand infill component is the HydroBinder® infill (See Section 03 49 01).
4. Gas Pressure Relief System (if applicable):
    a. Minimum one pressure relief valve per acre or the quantity specified by the Engineer based on landfill gas generation rate, whichever is more. (See DRAWINGS).

PART 3: EXECUTION:

Not Used.

END OF SECTION

This ClosureTurf® Specification document has been prepared to provide the Owner, Design Engineer, Construction Quality Assurance Professional of Record, and the Contractor / Installer with a general guidance specification. All information, recommendations and suggestions appearing in this specification concerning the use of our products are based upon experience, tests and data believed to be reliable; however, this information should not be used or relied upon for any specific application without independent professional examination and verification of its accuracy, suitability and applicability. Any statement made herein may not be absolutely complete since additional information may be necessary or desirable when particular or exceptional conditions or circumstances exist or because of applicable laws or government regulations. ClosureTurf® product (US Patent No. 7,682,105, 8,585,322, 9,163,375 and 9,199, 287*; Canadian Patent No. 2,663,170; and other Patents Pending) and trademark are the property of Watershed Geosynthetics LLC. Nothing herein is to be construed as permission to grant license or as a recommendation to infringe any patent.*

SECTION 01 73 19

ClosureTurf® INSTALLATION

PART 1: GENERAL

1.01 SUMMARY

A. Section Includes:

Specifications for the Installation of the ClosureTurf® System.

B. Products Installed but not Furnished under this Section.

1. ClosureTurf® System.

a. Include Sand Infill Component Installation.

b. Include Alternate HydroBinder® Infill Installation.

c. Include Alternate ArmorFill® Infill Installation

1.04 SUBMITTALS

A. MANUFACTURER:

1. Pre-Production Manufacturer's Quality Control (MQC) Data - Geomembrane Component:

    a. Submit to the OWNER'S REPRESENTATIVE prior to ordering of geomembrane component.

1.) Certificate of Compliance that shows proposed material for this project will meet the project specifications.

a.) Indicate tentative product order date and manufacturer location.

2.) Provide representative manufacturer Product Data sheets.

3.) Provide four (4) representative project product samples.

4.) Provide manufacturer's quality control program, including test procedures and frequencies for this product.

2. Pre-Shipment Manufacturer Quality Control (MQC) Data – Geomembrane Component:

    a. Submit to the OWNER'S REPRESENTATIVE prior to shipment of geomembrane component:

        1.) A copy of the MQC results.

2.) Statement that MQC testing has been done in accordance with manufacturer's quality control program.

3.) Certificate of Compliance stating:

a.) Production dates and origin of resin.

b.) Reclaimed resin does not exceed 10 percent by weight.

c.) Any remaining MQC certifications required by the CONTRACT.

4.) MQC Certifications will include:

a.) Geomembrane roll numbers and identification;

b.) Sampling procedures; and

c.) Results of MQC tests, and the test methods used.

3. Conformance Testing - Geomembrane Component:

a. Sampling required at Manufacturer's Plant prior to shipment:

1.) OWNER'S REPRENTATIVE will collect samples at the specified interval and sizes listed below:

a.) OWNER'S REPRESENTATIVE may also have a 3rd party collect the samples and have them shipped to an INDEPENDENT TESTING LABORATORY for testing.

2.) Take samples across entire roll width.

3.) Sample size: 15 inches x roll width.

a.) Indicate machine direction.

b.) indicate roll identification number.

c.) assign a unique conformance test number to the sample.

d.) mark sample with date listed above.

4.) Conformance samples:

a.) Obtain for each resin lot; and

b.) Each 100,000 sq. ft. of geomembrane.

5.) Forward samples to the Independent Testing Lab for the following tests as they relate to Section 01 60 00 - ClosureTurf® PRODUCT SPECIFICATION – Article 2.03:

a.) Density (ASTM D 792, Method B)

b.) Carbon black content (ASTM D 4218)

c.) Carbon black dispersion (ASTM D 5596)

d.) Thickness (ASTM D 5994)

e.) Tensile properties (ASTM D 6693/Type IV Specimen)

4. Limitations:

   a. No material will be delivered to the site until Independent Testing Lab results show conformance with the products specifications.
   b. The DESIGN ENGINEER will inform the INDEPENDENT TESTING LABORATORY in writing if additional test procedures are required.

5. MQC Testing – Engineered Turf Component:

   a. Provide inspection records of the tufting procedures for every 300,000 sq.ft. of Engineered Turf Include;
   b. Inspection records that indicate the following properties as they relate to Section 01 60 00 - ClosureTurf® Product Specification including;

      1.) Tufting Gauge;

2.) Pile height;

3.) Roll length and roll numbers;

4.) Total product weight

5.) CBR Puncture ASTM D6241

6.) Tensile Strength Product (lbs./ft.) (MARV) ASTM D 4595

7.) Tensile Strength of Yarn (lbs.) (MARV) ASTM D 2256

6. Conformance Testing – Engineered Turf

   a. Obtain one Engineered Turf sample for every 400,000 sq. ft. of material supplied to the site.

b. Forward samples to the INDEPENDENT TESTING LABORATORY and test for the following:

i. Total product weight
ii. CBR Puncture ASTM D6241
iii. Tensile Strength Product ASTM D 4595
iv. Tensile Strength of Yarn ASTM D2256

B. GEOSYNTHETICS INSTALLER

1. Prior to beginning the installation of the ClosureTurf® System, GEOSYNTHETICS INSTALLER shall submit the following to the OWNER'S REPRESENTATIVE as it relates to the Geomembrane Component and the Engineered Turf component:

a. The company will be an approved ClosureTurf Installer.
b. Shop drawings indicating panel layout and field seams 14 calendar days prior to installation of geomembrane component.
c. ClosureTurf® Installation schedule.
d. Installation capabilities, including:

1.) Information on seaming, testing and deployment equipment proposed for this project;
2.) Average daily production anticipated for this project; and
3.) Construction Quality Control (CQC) procedures.
4.) Submit to OWNER'S REPRESENTATIVE:

a.) Signed Subgrade Acceptance Certificates for each area to be covered by the geomembrane component.
b.) A flow chart showing GEOSYNTHETICS PERSONNEL responsible positions for this project and include;

c.) Resumes of: (Include date hired and duration of employment)

i. Project designated GEOSYNTHETICS SEAMING SUPERVISOR;

ii. CQC SUPERVISOR if other than above;

iii. All personnel who will perform seaming operations; including

iv. date hired and duration of employment.

d.) Verify in writing that GEOSYNTHETICS INSTALLER'S PERSONNEL have the following experience:

i. CQC SUPERVISOR and the MASTER GEOMEMBRANE SEAMER:

i.) Shall have installed at least 5,000,000 square feet of like geosynthetics components.

ii. CQC SUPERVISOR and the ENGINEERED TURF FUSION SEAMER

ii.) Shall have installed at least 5,000,000 square feet of geomembrane materials.

iii.) Engineered Turf Fusion Seamers shall be factory trained by DemTech.

iii. GEOTEXTILE SEAMERS:

iv.) Shall have installed at least 1,000,000 square feet of like materials.

iv. All other GEOSYNTHETICS INSTALLER SEAMING PERSONNEL:

v.) Shall have seemed at least 1,000,000 s.f. of polyethylene geomembrane.

vi.) Personnel who have seemed less than 1,000,000 s.f. of polyethylene geomembrane will be allowed to seam only under the direct supervision of the MASTER GEOMEMBRANE SEAMER or CQC SUPERVISOR.

e.) OWNER'S REPRESENTATIVE shall be responsible for approving resumes and qualifications of GEOSYNTHETICS INSTALLER PERSONNEL.

f.) GEOSYNTHETICS INSTALLER PERSONNEL shall attend ClosureTurf® orientation prior to the job beginning if this is their first ClosureTurf® installation.

C. SAND INFILL INSTALLER:

1. SAND INFILL INSTALLER shall submit to ClosureTurf® manufacturer a 10 pound sample of sand infill utilized.

2. SAND INFILL INSTALLER shall submit particle size data sheets approved by the POR for:

   a. Sand infill used as a ClosureTurf® Component; and
   b. Every 175 CY delivered thereafter.

      1.) Sand Infill Testing Parameters:
      See SECTION 31 05 16 ClosureTurf® SAND INFILL COMPONENT

D. CLOSEOUT SUBMITTALS:

1. GEOSYNTHETICS INSTALLER shall furnish to the OWNER upon completion of the project:

   a. 1-year warranty against defects in workmanship.
   b. As-built Geomembrane Panel Drawings.
   c. As-built Drawings will include:
   d. panel locations;
   e. panel identification numbers;
   f. geomembrane roll numbers for each panel;
   g. seam caps;
   h. destructive sample locations; and
   i. location of large repairs.
   j. Any other documentation required under Section 01 73 19 – G

E. PRODUCT DATA

1. See Section 01 60 00 PRODUCT SPECIFICATION – Article 2.03

F. CERTIFICATES

i. CONTRACTOR will provide a set of as-built record drawings and a QC data package when the project is completed, for submittal to the agency. All construction methods and test procedures documented on the project will be in accordance with project specifications.

ii. Surveying and documenting various aspects of the as-built package (location of destruct samples, etc.) will be the CONTRACTOR'S responsibility.

1.05 DELIVERY, STORAGE AND HANDLING

A. Conform to the manufacturer's recommendations to prevent damage.

B. Deliver materials to the site only after the OWNER'S REPRESENTATIVE and the OWNER approve required submittals.

1. CQA PERSONNEL shall observe and document that all rolls of geomembrane delivered to the site have been properly identified (at the manufacturer's location) with the following for each component:

a. Delivery and Acceptance Requirements –Geomembrane Component:

1.) Manufacturer's name
2.) Product identification
3.) Lot number
4.) Roll number
5.) Roll dimensions

b. Delivery and Acceptance Requirements –Engineered Turf Component:

1.) Manufacturer's name
2.) Product identification
3.) Lot number
4.) Roll number
5.) Roll dimensions

2. CQA PERSONNEL shall observe and document the following with regard to each component:

a. Engineered Turf is wrapped in rolls with protective covering;
b. Components are protected from any outside source that could degrade or damage the product.

A. Storage and Handling Requirements:

1. On-Site Storage

a. Store in space allocated by the OWNER.
b. Store on level prepared surface (not on wooden pallets) graded to drain away from ClosureTurf® components.
c. Stack per Manufacturer's recommendation but no more than three rolls high.

2. On-Site Handling:

a. The GEOSYNTHETICS INSTALLER is responsible for storage and transporting material from storage area to installation area
b. Use appropriate handling equipment approved by the OWNER'S

REPRESENTATIVE.

c. Dragging panels on ground surface will not be permitted.

d. Do not fold geomembrane component material;

3. Packaging and Waste Management

a. GEOSYNTHETICS INSTALLER shall be responsible for proper containment, collection and disposal of:

1.) Waste and packaging;

2.) All waste products produced by the installation of the ClosureTurf® System.

1.06 SITE CONDITIONS

A. Ambient Conditions

1. In excessive heat or cold, ambient temperatures less than 35°F and greater than 104°F will require additional testing as indicated below.

2. The acceptable ambient temperature range may vary from parameters shown in Article 1.06A-1 only if field test seams can pass at the specific ambient temperature welding will take place.

B. Existing Conditions

1. See Section 31 23 13 for Subgrade Preparation Specifications

PART 2: PRODUCTS

2.01 OWNER FURNISHED PRODUCTS

A. Fabricated and Geosynthetic components of the ClosureTurf® System.

1. Geomembrane Component.

    a. Manufacturer: AGRU America, Inc.

2. Engineered Turf Component.

    a. Shaw Industries, Inc.

B. Gas Vents.

    a. Watershed Geosynthetics, Inc.

C. SUBSTITUTIONS

    a. None

2.02 PRODUCTS NOT FURNISHED BY OWNER

A. Sand Infill Component. (Section 31 05 16)
B. Alternate HydroBinder® Infill Component. (See Section 03 49 01)

2.03 EQUIPMENT

A. GEOSYNTHETICS INSTALLER shall demonstrate that welding equipment and accessories meet the following requirements:
    1. Wedge welding machines are a low profile machine with a vertical height (wedge height) not to exceed 3 inches, measured from flat surface to top of heating wedge.
    2. Welding machines are equipped with gauges showing temperatures both in apparatus and at nozzle (extrusion welder) or at wedge (fusion welder).
    3. Adequate numbers of welding apparatus are maintained to avoid delaying work.
    4. Use power source generators capable of providing constant voltage to all required equipment under combined-line load.

5. Provide secondary containment to catch spilled fuel under equipment where applicable.

B. Provide calibrated tensiometer capable of quantitatively measuring geomembrane component strength for the following parameters:

    a. Tensiometer to be equipped with gauge accurate to +/- 2 lbs per inch of geomembrane width; and
    b. capable of pulling at 2 inches per minute up to 20 inches per minute.

C. Provide one inch die for cutting sample specimens.
D. Provide certificate of tensiometer calibration within the past 12-months.

2.04 PRODUCT OPTIONS

A. Infill Component Option will be noted on the DRAWINGS:

1. Sand Infill. See Specification 31 05 16 – Sand Infill Specifications; or

2. HydroBinder® Infill. 03 49 01 – Alternate HydroBinder® Infill.

2.05 MANUFACTURER QUALITY CONTROL (MQC)

A. Tests and Inspections

1. See Section 01 73 19 - 1.04 SUBMITTALS for MQC requirements.

2. See Section 01 73 19 - 3.02 FIELD TRIAL SEAM TESTING for field testing requirements.

2.06 CONSTRUCTION QUALITY CONTROL

A. GEOSYNTHETICS INSTALLER shall:

1. Designate a full-time construction quality control (CQC) SUPERVISOR; who

2. Shall be responsible for supervising and/or conducting the construction

quality control program; and

3. May not be replaced without written authorization by the OWNER.

4. Meets resume requirements Section 01 73 19 – 1.04 B

PART 3: EXECUTION:

3.01 INSTALLERS

A. Must be approved through Watershed Geosynthetics, LLC.

3.02 EXAMINATION

A. VERIFICATION OF CONDITIONS:

1. OWNER'S REPRESENTATIVE:

a. Verify provisions set forth in Section 31 23 13 – SUBGRADE PREPARATION.
b. Verify SUBMITTALS and forms have been completed.

B. PRE-INSTALLATION TESTING

1. FIELD TRIAL SEAM TESTING – TRIAL WELDS: GEOMEMBRANE

a. Prior to geomembrane component welding, CQA personnel shall observe and document the following:

1.) Welding apparatus (both wedge and extrusion welder) are tested;
a.) at daily start-up; and
b.) immediately after any break; or
c.) anytime the machine is turned off for more than 30 minutes.

b. Procedures:

1.) If at any time, the CQA PERSONNEL believe that an operator or welding apparatus is not functioning properly, a Field Trial Seam Test must be performed.

2.) Any dispute concerning proper installation techniques or the proper function of welding equipment shall be resolved by the OWNER'S REPRESENTATIVE.

3.) The trial weld must be allowed to cool to ambient temperature before testing.

a.) Trial Sample Test Results:

4.) Trial weld samples must comply with "PASSING CRITERIA FOR WELDS" included in Section 3.13.

5.) Field Seam Test Failure:

a.) Unacceptable locus-of-break codes per their description in ASTM D6392:

i. Hot Wedge: AD and AD-Brk>25%

ii. Extrusion Fillet: AD1, AD2, AD-WLD (unless strength is achieved)

b.) There will be no apparent weld separation (i.e., greater than 25% of weld width)

c.) The INDEPENDENT TESTING LABORATORY strength tests must;

i. meet the manufacturer's specifications for the sample sheets; or

ii. percentage of the manufacturer's parent sheet strength as determined by the manufacturer.

iii. For dual-track fusion welds, both sides (the inner and outer weld) must meet the minimum requirements for a satisfactory peel test.

c. Additional Field Seam Testing Requirements - GEOMEMBRANE

1.) A trial weld will also be obtained prior to welding tie-ins.

2.) The trial weld sample must be 3 feet long and 12 inches wide, with the seam centered lengthwise.

3.) If a welding apparatus exceeds 5 hours in the second half of the day, another trial seam must be performed.

4.) Minimum required number of specimens per trial weld:

i. Two coupons for shear and two coupons for peel.

ii. Both the inner and outer welds of dual track fusion welds:

vii.) must be tested for each peel test coupon; or

viii.) additional coupons will be required.

d. CQA documentation of trial seam procedures will include the following:

1.) The names of the seaming personnel;

2.) The name of the welding technician;

3.) the welding apparatus number, time, date;

4.) ambient air temperature; and

5.) welding apparatus temperature.

2. FUSION SEAMING METHOD TRIAL SEAM REQUIREMENTS – ENGINEERED TURF

a. Prior to turf component welding, CQA personnel shall observe and document the following:

1.) Turf welding apparatus are tested;
2.) at daily start-up; and
3.) immediately after any break; or
4.) anytime the machine is turned off for more than 30 minutes.

b. Procedures:

1.) If at any time, the CQA Personnel believe that an operator or fusion welding apparatus is not functioning properly, a Field Trial Seam Test must be performed.
2.) Any dispute concerning proper installation techniques or the proper function of fusion welding equipment will be resolved by the OWNER'S REPRESENTATIVE.

c. The trial weld must be allowed to cool to ambient temperature before seam snapping or panel adjustments are applied.

1.) Trial Sample Test Results:

i. Trial weld samples must comply with "VISUAL PASSING CRITERIA" Visual passing criteria is verified when a manual peal/pull test is performed, and the top turf panel tufts transfer to the bottom turf panel. The transfer of approx. 75% of the tufts constitutes a passing trial weld.

2.) Field Seam Test Failure:

i. Less than approx.75% of the top turf panel tufts transfer to the bottom turf panel.

3.) Additional Trial Sample Testing Requirements:

i. Two consecutive trial welds meet the visual passing criteria.

4.) The trial weld sample must be a minimum of 3 feet long and 12 inches wide, with the seam centered lengthwise.

5.) If a welding apparatus exceeds 5 hours in the second half of the day, another trial seam must be performed.

6.) CQA documentation of trial seam procedures will include the following:

ii. The names of the seaming personnel;

iii. The name of the fusion seaming technician;

iv. the welding apparatus number, time, date;

v. ambient air temperature; and

vi. welding apparatus temperature.

3.03 INSTALLATION

A. ClosureTurf® GEOMEMBRANE COMPONENT DEPLOYMENT

1. Geomembrane Component will not be deployed:

    a. During precipitation;
    b. In the presence of excessive moisture as determined by the CQA Personnel onsite;
    c. In areas of ponded water;
    d. In the presence of excessive winds (sustained winds greater than 25 MPH) or at the discretion of the POR.

2. CQA PERSONNEL shall observe the following while the geomembrane component is being deployed:

    a. Use equipment which will not damage geomembrane.
    b. Observe that personnel working on geomembrane do not engage in activities that could damage ClosureTurf® Components.
    c. Smoking on the liner is prohibited.
    d. Clamps and other metal tools are not tossed or thrown.
    e. Geomembrane component has had adequate time to acclimate to ambient temperature prior to welding.
    f. Panels are deployed with the spike down and the stud side up.
    g. The deployment method will protect both the geomembrane component as well as the underlying subgrade.
    h. Adequate anchoring techniques are placed to prevent uplift by wind.
    i. Anchoring techniques are used that will not damage the geomembrane component.
    j. Continuous sand bags are used along leading edges of the geomembrane to reduce wind flow under panels.
    k. Panels will be deployed perpendicular to slope elevation contours.
    l. Generation of seams will be reduced where possible.
    m. Protect geomembrane in heavy traffic areas using methods approved by the POR.
    n. Rubber tired ATV's are acceptable if specified wheel pressure limitation is

specifically observed and provided to the POR by the GEOSYNTHETICS INSTALLER in writing.

o. The bottom and side anchor trenches are left open until the engineered turf and sand infill placement are complete.

p. Top anchor trenches are backfilled as soon as practical to avoid creeping of the geomembrane.

q. Verify that the ClosureTurf® system is properly deployed into the anchor trench prior to backfilling.

r. Where possible, anchor trenches are filled when temperatures are coolest to reduce bridging of the geomembrane component.

s. Material placed in anchor trenches are placed in uniform lifts, not to exceed 12 inches loose thickness and are compacted.

t. In-place moisture/density tests in anchor trenches may be taken at the discretion of the POR.

u. Slightly rounded corners will be provided in anchor trenches.

3.04 WRINKLES

A. The CQA PERSONNEL shall:

1. Inspect geomembrane for wrinkles; and

2. Notify the GEOSYNTHETICS INSTALLER if wrinkles are present above the maximum tolerance level as described below.

3. Document corrective actions taken to reduce the wrinkles.

4. Observe that wrinkles are reduced prior to field seaming.

5. Observe that snapping procedures described in Article 3.06 SPECIAL TECHNIQUES are followed.

B. Any wrinkles that can fold over must be repaired if:

1. Overnight temperature reduction does not contract the geomembrane to an

acceptable level as determined by the CQA PERSONNEL.

C. Time constraints do not allow for an overnight wait time to observe whether wrinkles were reduced adequately.

3.05 ClosureTurf® GEOMEMBRANE COMPONENT FIELD SEAMING

A. CQA PERSONNEL must observe the following:

1. Prior to geomembrane seaming operations:

a. Panel layout drawing has been accepted by the POR.
b. A seam numbering system has been incorporated agreed upon by the POR and GEOSYNTHETICS INSTALLER prior to the start of seaming operations.
c. The GEOSYNTHETICS INSTALLER shall have a previously agreed upon number of welding apparatus and spare parts necessary to perform the work.
d. Verify that equipment used for welding will not damage any ClosureTurf® system components.
e. The extrusion welding machine is purged to remove heat degraded extrudate.
f. Seam grinding has been completed less than one hour before seam welding; and
g. The upper sheet is beveled (extrusion welding only).
h. The ambient temperature requirements (Section 1.06 SITE CONDITIONS), are met.
i. The contact surfaces of the sheets are clean, free of dust, grease, dirt, debris, and moisture prior to welding.
j. The weld area is substantially free of dust, rocks, and other debris.
k. The seams are overlapped a minimum of 3 inches for extrusion and hot wedge welding, or in accordance with manufacturer's recommendations, whichever is more stringent.
l. Panels will be overlapped (shingled) in the downgrade direction.

m. No solvents or adhesives are present in the seam area.
n. The procedure used to temporarily hold the panels together does not damage the panels and does not preclude CQA testing.
o. The panels to be welded are in accordance with the plans and site specific specifications.
p. There is no obvious free moisture in the weld area.
q. Measure and document surface sheet temperature every two hours.
r. At the end of each day or installation segment, unseamed edges are anchored with sandbags or other approved anchoring device.

2. During Geomembrane Seaming Operations:

a. At the end of previously placed welds, (with a cooling time longer than 5 minutes), grinding is required to expose new material before restarting a weld (extrusion welding only).

3.06 SPECIAL TECHNIQUES

A. During field seaming operations special attention will be taken for the following:

1. GEOMEMBRANE COMPONENT:

a. Once two panels have been seamed together or at the approx. 1/3 seaming process, a seam snapping process should be applied.

1.) Perform with manual labor by utilizing 3-4 technicians on the open side of the panel applying a pulling pressure to snap out the tented welded seam.

2. ENGINEERED TURF COMPONENT:

a. CQA PERSONNEL shall verify that:

2.) Engineered Turf tufts are not excessively pulled out by the installation process.
3.) See Section 01 73 19 – Article 3.07 for further information.

3.07 ENGINEERED TURF COMPONENT DEPLOYMENT

A. Prior to installation of Engineered Turf Component, the CQA PERSONNEL must observe the following:

1. ClosureTurf® geomembrane component has been seamed, tested, approved, and is released for further component deployment by the POR.

2. The supporting surface (e.g., the geomembrane) is substantially free of debris or large scraps.

B. During deployment of Engineered Turf, the CQA personnel must observe the following:

1. Observe the turf as it is deployed and record defects and disposition of the defects (i.e., panel rejected, patch installed, etc.).

2. That repairs are made in accordance with the specifications.

3. Equipment used does not damage the turf or underlying geomembrane.

4. That all panels are deployed from the top of the slope in a way that the Engineered Turf filaments are pointing upslope after deployment is complete.

5. That the turf is anchored to prevent movement by the wind (the GEOSYNTHETICS INSTALLER is responsible for any damage resulting to or from windblown Engineered Turf).

6. That the turf remains substantially free of contaminants.

7. That the turf is laid substantially smooth.

8. That on slopes, the turf is secured with sandbag anchoring at the top of the slope after deployment.

9. That the first panel deployed has the turf filaments facing upward.

10. That subsequent panels are deployed turf side down, and on top of the previous panel. (Sewing Method Only)

11. That after seaming each panel, it is flipped onto the geomembrane component with care to avoid pulling of tufts in the drainage studs. (Sewing Method Only)

12. A single stitch prayer type seam is constructed using a Newlong sewing machine or equivalent. (Sewing Method Only)

13. The thread will be 207 Polyester or equivalent.

14. Sewing will occur between the 1st and 2nd row of tufts on both sides of panel.

3.08 ENGINEERED TURF COMPONENT FUSION SEAMING METHOD:

A. Techniques for Fusion Seaming Engineered Turf will be as follows:

1. Engineered Turf fusion seaming device will be a DemTech VM20/4/A fusion welder only.

2. Fusion seams require a minimum of 5 inches of overlap.

3. Frayed or loose geotextile strands will be cut off or removed.

4. Prior to starting the production fusion seaming, trial seams must be performed as outlined in Section 3.02.

5. Demonstrate the preparation methods and equipment utilized for removal of the selvage from the outside edge of the rolls of turf (i.e. trimming & cutting devices).

6. Mechanical or hot knife trimming and cutting devices will be utilized for salvage trimming.

7. Demonstrate and control the fraying of geotextile strands when performing the

removal of selvage.

8. Any damage that occurs due to production seaming will be repaired as outlined in WG Installation Guidance Documents.

9. Any defects will be repaired as outlined in Section 3.14.

3.09 EQUIPMENT ON THE TURF:

A. During Construction:

1. On slopes exceeding 15%:

   a. No equipment will be allowed until Sand Infill is in place.

2. On slopes less than 15%:

   a. ATV type vehicles will be allowed prior to infill placement if the tire /track ground contact pressure is less than 5 psi.

B. Post construction (full specified sand infill thickness)

1. On slopes exceeding 15%

   a. Temporary or transient loads, allowable tire/track ground contact pressures will be limited to less than 35 psi
   b. Regularly trafficked areas will be designed and approved by the POR and/or CQA Engineer

2. On slopes less than 15%:

   a. Temporary or transient loads, allowable tire/track ground contact pressures will be limited to less than 85 psi
   b. Regularly trafficked areas will be designed and approved by the POR
   c. Allowable tire/track ground contact pressures may be increased with the written approval of the POR and/or CQA Engineer.

C. Any activity that may be identified during the course of construction by the POR, OWNER'S REPRESENTATIVE, or CQA PERSONNEL as being a possible danger to the integrity of the ClosureTurf® system will prohibited regardless of any prior approval.

3.10 SAND BALLAST INFILL PLACEMENT

A. Sand infill that is placed between the tufts of the Engineered Turf Component:

1. The sand infill layer will be placed to a ½ inch minimum thickness not to exceed ¾ inch thick.

2. Will consist wholly of sand meeting Section 31 05 16, ClosureTurf® SAND INFILL COMPONENT.

3. CQA PERSONNEL shall check final thickness of sand infill at a rate of approximately 20 times per acre.

B. ClosureTurf® Sand Infill Grain Size Parameters are shown in Section 31 05 16 – Table 1.

1. CQA PERSONNEL shall observe that the following requirements regarding Sand Infill are met:

   a. Installation of sand infill will only be performed by a Watershed Geosynthetics' licensed and approved installer.
   b. Areas that are to receive sand infill must be accepted by the POR or CQA PERSONNEL before placement of sand infill takes place.

C. CQA PERSONNEL shall observe:

1. The sand infill is worked into the Engineered Turf between the synthetic yarn

blades.

2. Conveyor systems and/or Express Blowers will be used to spread and place the sand infill.

3. Sand Infill Installer has explained with detail in the pre-construction meeting the method of sand infill deployment to be used.

4. That previously installed ClosureTurf® components are not displaced or damaged as a result of the sand infill component installation.

5. That Sand infill placement does not occur with snow or ice on the Engineered Turf component.

6. The method for measuring the Sand Infill thickness will be performed utilizing a digital caliper, or a POR approved alternate measuring device.

3.11 ALTERNATE INFILL – HYDROBINDER® PLACEMENT

A. See Section 03 49 01 ALTERNATE HydroBinder® INFILL for Product Specification
B. The HydroBinder® infill layer may be placed using any appropriate equipment capable of completing the work.

1. Manual hand spreading is acceptable when equipment isn't practical.

C. CQA PERSONNEL shall verify the following:

2. GEOSYNTHETICS INSTALLER shall explain in detail in the pre-construction meeting the method of HydroBinder® infill deployment.

3. Installation of HydroBinder® infill will only be performed by a Watershed Geosynthetics' licensed and approved installer.

4. Additional information concerning various Installation Techniques can be found in the ClosureTurf® Installation Guidelines Manual.

5. The HydroBinder® will be installed into the turf while it is in a dry state.

6. The HydroBinder® will be worked into the tufts so the tufts are in an upright position.

7. The HydroBinder® infill layer will be placed to a ¾ inch minimum thickness not to exceed 1 inch thick.

8. Multiple passes will be required so the tufts can be more readily freed from the weight of the HydroBinder® on each pass before hydration takes place.

9. Engineered Turf Tufts will be free and upright before the hydration process begins.

10. HydroBinder® thickness will be checked using a caliper or other approved measuring device.

    a. Take thickness measurements of the dry HydroBinder at a rate of 20 samples per acre.
    b. The desired HydroBinder® infill thickness will be achieved prior to the hydration process.

11. Do not backfill horizontal or vertical anchor trenches until turf has been infilled with HydroBinder® infill.

12. The hydration process must occur the same day as the HydroBinder® infill placement.

    c. Check to assure HydroBinder® is hydrated thoroughly through the full thickness, without causing excessive runoff using the following methods:

        1.) Check each completed hydration area for full saturation using a probe before moving on the next area.
        2.) Check hydration with probe at a rate of 1 per 100 sq. ft..
        3.) Check for full hydration by tapping on hydrated surface forcing water to be visually

seen pooling at the surface.

    d. The estimated application rate is 0.20 gallons of water per sq. ft.

1.) Rate may change according to ambient temperature and humidity.

e. After 24 hrs.;

1.) Check completed HydroBinder to ensure the hardening process is taking place.

a.) Note that the dustless version of HydroBinder® may take longer than 24 hrs to reach an obvious hardness to the touch.

f. The 28 day compression strength of the HydroBinder® is verified by the manufacturer of the HydroBinder® before the mix is delivered to the site.

D. Cold Weather Placement and Curing of HydroBinder®.Follow Procedure shown in American Concrete Institute (ACI) 306 – Guide to Cold Weather Concreting.

1. At the time of HydroBinder placement;

a. both the subgrade and the surface of the Engineered Turf will be at a temperature of at least 36 degrees.

b. Ambient temp will be rising.

3.12 ALTERNATE INFILL – ARMORFILL® EMULSION

A. See also Section 31-32-13.17 -ArmorFill® -Polymer Emulsion Specification

B. INSTALLERS

1. Installation of ArmorFill® will be completed by an installer approved by Watershed Geosynthetics.

C. EXAMINATION

1. ArmorFill® should be shipped to site within one (1) month of anticipated use.

2. Apply ArmorFill® under dry weather conditions and when precipitation is not expected for at least 72 hours after installation.

3. ArmorFill® cure time is dependent on ambient temperature, humidity and any rainfall that may occur while product is curing.

4. Apply ArmorFill® on a previously installed ClosureTurf® system that is free of

leaves and other material that may inhibit the penetration of the ArmorFill® into the sand component.

5. Apply ArmorFill® only after approval of the finished ClosureTurf® product installation.

6. Construction Quality Control (CQC) personnel will document ArmorFill® and water mix ratio by logging volume mixed of each component.

7. Construction Quality Control (CQC) personnel will verify that ArmorFill® has fully saturated the sand by inserting a probe and displacing a 1 sq. inch area of sand.

    a. Check saturation randomly at a rate of 20 probes per acre.

8. Verify proper application rate by marking a known area and applying the proper volume to that area.

    a. Adjust delivery rate to match the delivery volume per area.

D. SPECIAL TECHNIQUES

1. Mix in a hydraulic conveyance system such as a water truck, HydroSeeder or portable tank.

    a. Place the water component in the tank, then add the full strength ArmorFill® .

    b. Mechanically agitate initially, and each day prior to use.

    c. Do not utilize continuous agitation techniques that may introduce excess air into the system.

2. ArmorFill® application equipment will have a hose with a spray adjustment nozzle and cut off function in the nozzle head.

3. Reduce the number of equipment set-ups required and take care with the application hose so as previously applied ArmorFill® is not displaced by dragging of the hose.

4. Spray product evenly.

5. Apply marking features to edge of sprayed area to assure proper overlap of material.

6. Each stopping point will require visual marking locations to assure the continued application has the proper overlap.

7. Deploy catch cups at a rate of 20 per acre to help determine if proper application rate is being achieved.

8. Apply ArmorFill® at a rate of approximately 3400 gallons of the mixed product per acre (Approx. 90 ounces per square yard)

9. Do not apply ArmorFill® in inclement weather or in freezing temperatures.

10. One Thousand Six Hundred Fifty (1650) gallons of water per Two Hundred Seventy Five (275) gallon ArmorFill® tote is the proper mixture for a 6:1 ratio.

E. CLOSE OUT ACTIVITIES

1. At the completion of ArmorFill® placement activities, clean the equipment thoroughly and purge the tank and hoses of the product.

2. All waste product will be disposed of in accordance to site regulations and specifications.

3. Left over mixed product may be evenly sprayed over previously applied ArmorFill® areas.

4. Avoid unnecessary foot traffic on the applied product for 48 hours.

5. No vehicle traffic is allowed on the applied product for 7 calendar days.

3.13 TESTING CONCURRENT WITH INSTALLATION:

A. DESTRUCTIVE AND NON-DESTRUCTIVE TESTING:

1. NON-DESTRUCTIVE SEAM TESTING – Geomembrane Component:

a. GEOSYNTHETICS INSTALLER shall:

1.) non-destructively test field welds for continuity over their full length using vacuum, air pressure or spark test units; and

a.) Perform concurrently with seaming work progress.

b.) Repair seam defects in accordance with Article 3.14 REPAIR PROCEDURES.

2.) Non-destructive testing procedures:

a.) apparatus used to test the field seams for continuity:

i. Vacuum box testing equipment for extrusion welds will have:

ii. A rigid housing;

iii. transparent viewing window;

iv. a soft rubber gasket attached to bottom of housing; and

v. porthole or valve assembly; and

vi. a vacuum gauge.

vii. be capable of applying 2 psi gage pressure of vacuum to the box.

viii. Soapy solution.

b.) Vacuum Box testing procedures:

i. Clean window, gasket surfaces, and check for leaks.

ii. Energize vacuum pump and reduce tank pressure to approximately 2 psi.

iii. Wet a strip of geomembrane approximately 12 inches by 30 inches (or length of box) with soapy solution.

iv. Place box over wetted area and compress.

v. Close bleed valve and open vacuum valve.

vi. Ensure that a leak tight seal is created.

vii. Examine length of weld through viewing window for presence of soap bubbles for a period of not less than 10 seconds.

viii. If no bubbles appear after 10 seconds, close vacuum valve and open bleed valve, move box over next adjoining area with minimum three inches overlap and repeat process.

c.) Defects:

i. Mark with a defect code;

ii. repair the area in accordance with Section 01 73 19 Article 3.14 REPAIR PROCEDURES; and

iii. retest the repaired area.

d.) Air Pressure Testing equipment for double fusion seams:

i. An air pump, equipped with pressure gauge having an accuracy of 1 psi, capable of generating and sustaining a pressure between 25 to 30 psi and mounted on a cushion.
ii. Rubber hose with fittings and connections.
iii. Sharp hollow needle or other pressure feed device approved by the Owner.

e.) Air Pressure testing procedures:

i. Seal both ends of the seam to be tested.
ii. Insert a needle or other approved pressure feed device into tunnel created by double hot wedge seaming and insert a protective cushion between air pump and geomembrane.
iii. Energize air pump to 25 to 30 psi, close valve, and sustain pressure for a minimum of five minutes.
iv. If loss of pressure exceeds 2 psi or does not stabilize, locate faulty area and repair in accordance with Article 3.14 REPAIR PROCEDURES.
v. Release pressure at opposite end of seam from gauge to verify that the seam is not blocked.
vi. Remove approved pressure feed device and seal penetration holes by extrusion welding.

b. DESTRUCTIVE SEAM TESTING Geomembrane Component:

a. GEOSYNTHETICS INSTALLER shall:

1.) cut destructive samples 12 inches wide by 48 inches long with seam centered lengthwise.

2.) Repair holes in geomembrane resulting from obtaining destructive samples and vacuum test patches.

3.) Obtain two 1-inch wide specimens from each side of the sample, test for peel and shear in the field.

i. Provide OWNER'S REPRESENTATIVE with the following:

(i) one sample per 500 feet of seam length per welding apparatus prior to completion of liner installation;

b. OWNER'S REPRESENTATIVE shall:

1.) mark destructive samples with:

a.) consecutive numbering;

b.) location;

c.) apparatus I.D.;

d.) technician I.D.;

e.) Engineer I.D.;

f.) apparatus settings; and

g.) date;

2.) record, in written form:

a.) weld and test date;

b.) time;

c.) location;

d.) seam number;

e.) ambient temperatures;

f.) machine settings;

g.) technician I.D.;

h.) apparatus I.D.; and

i.) pass or fail description.

c. Additional Destructive Testing Procedures:

1.) Cut ten 1-inch wide specimens from one piece.

2.) Test five specimens for peel and five for shear.

3.) Test results will meet requirements of Section 01 73 19 - INSTALLATION OF ClosureTurf® - Article 3.13.B – PASSING CRITERIA FOR WELDS.

4.) Failing Destructive Tests:

a.) GEOSYNTHETICS INSTALLER'S CQC REPRESENTATIVE shall;

a.) track the failure immediately.

b.) Cut the remaining sample into three 14-inch long pieces and distribute as follows:

i. To the Owner's Representative for destructive testing; and

ii. To the Owner's Representative for archive; and

iii. To the Geosynthetics Installer for their use.

c.) In the event of failure, the procedures for failed seam tracking are:

i. Retrace welding path 10 (ten) feet in both directions from the failed test location and remove (at these locations) a one inch wide specimen for testing.

ii. Obtain destructive samples from each side of the welding path and give samples to the OWNER'S REPRESENTATIVE for destructive testing.

iii. Repeat process if additional tests fail.

iv. Reconstruct seam between passing test locations to satisfaction of the OWNER'S REPRESENTATIVE.

v. Reconstruction may be one of the following:

(ii) Cut out old seam, reposition panel and re-seam.

(iii) Add cap strip.

(iv) Cut additional destructive samples from reconstruction at discretion of OWNER'S REPRESENTATIVE.

(v) If additional destructive sample results are not acceptable, repeat process until reconstructed seam is judged satisfactory by the OWNER'S REPRESENTATIVE.

5.) Final seaming inspection:

a.) check the seams and surface of geomembrane for:

i. Defects;

ii. Holes;

iii. Blisters;

iv. Undispersed raw materials; or

v. Signs of contamination by foreign matter.

b.) Brush, blow, or wash geomembrane surface if dirt inhibits observation.

c.) The OWNER'S REPRESENTATIVE shall decide if cleaning of geomembrane surface and welds is needed to facilitate inspection.

B. PASSING CRITERIA FOR WELDS

1. Passing criteria are established by Geosynthetic Institute Test Method GM-19 for geomembrane seams.

a. An extrusion or fusion-welded seam will pass when the following values are met:

1.) Shear and peel strengths are for 4 out of 5 test specimens (the 5th specimen can be as low as 80 percent of the listed values)

2.) Shear strength (lb./in) 100

3.) Shear elongation at break (%) 50

4.) Peel strength (lb./in) 75 (65 extrusion weld)

5.) Peel separation (%) 25

6.) A geomembrane seam sample passes the field testing when:

a.) the break is a film tear bond (FTB); and

b.) the seam strength meets the required strength values for peel and shear given previously in Section 01 60 00 -

c.) For dual track welds, both welds must pass.

7.) Elongation measurements should be omitted for field-testing.

3.14 REPAIR PROCEDURES

A. GEOMEMBRANE COMPONENT:

1. The GEOSYNTHETICS INSTALLER shall be responsible for repair of damaged or defective areas.

B. Agreement upon the appropriate repair method will be decided between the OWNER'S REPRESENTATIVE and the GEOSYNTHETICS INSTALLER.

1. Procedures available include:

a. Patching:

1.) Used to repair holes (over 1/4-inch diameter), tears (over 1/4 inch long), undispersed raw materials, and contamination by foreign matter.

2.) Grinding and welding:

a.) Used to repair pinholes, and blemishes.

3.) Capping:

a.) Used to repair large lengths of seams.

4.) Removing the seam and replacing with a strip of new material.

b. The CQA Personnel will observe and document the following:

1.) The surface of the geomembrane component is clean at the time of inspection.

2.) Non-conforming geomembrane component is removed and replaced;

3.) Any portion of the geomembrane component exhibiting a flaw identified as defective by the POR or CQA PERSONNEL is replaced;

4.) Repair areas are distinctively marked and the required type of repair is indicated.

c. Repair Methods:

1.) Geomembrane surfaces to be repaired will be abraded (extrusion welds only) no more than 1/2 hour prior to the repair.
2.) All geomembrane surfaces will be clean and dry at the time of repair.
3.) The repair procedures, materials, and techniques will be approved in advance of the specific repair by the OWNER'S REPRESENTATIVE.
4.) Patch Requirements:
a.) will be a minimum of 12 inches in diameter with all corners rounded; and

b.) Will extend at least 6 inches beyond the edge of the defect.
c.) Temporarily bond the patch to the geomembrane with an approved method;
d.) Extrusion weld the patch; and
e.) Vacuum test the repair.

d. Repair Verification:

1.) CQA PERSONNEL shall number and log each patch repair
2.) CQC REPRESENTATIVE shall non-destructively test each repair using methods specified in Article 3.13.
3.) Provide daily documentation of non-destructive and destructive testing to the OWNER'S REPRESENTATIVE.
4.) The documentation will identify;
a.) Seams that initially failed the test; and
b.) Include the evidence that these seams were repaired and retested successfully.

C. ENGINEERED TURF COMPONENT:

A. When Repairs and Tie-Ins of Engineered Turf occur, the CQA PERSONNEL must observe the following:

1. Repairs to Engineered Turf are completed by using a heat-bonded seam.

2. All tie-in seams along flatter slopes (i.e. 15% or less) with length greater than

25 feet will use an approved heat bonded seam so as consistent pressure is achieved throughout the seam.

3. A hand held heat gun with a pressure wheel will be used in smaller/concentrated areas.

4. GEOSYNTHETICS INSTALLER may also demonstrate techniques and practices for Watershed Geosynthetics' approval.

    a. Field demonstration and approval by the OWNER'S REPRESENTATIVE is required before incorporating any alternative technique.

3.15 INSTALLATION ACCEPTANCE

A. The Geosynthetics Installer retains all ownership and responsibility for the ClosureTurf® system until acceptance by the Owner.

1. After all ClosureTurf® components are deployed, seamed, has passed required testing successfully, and any repairs are made;

    a. The completed installation will be inspected by the OWNER'S REPRESENTATIVE and the GEOSYNTHETICS INSTALLER'S CONSTRUCTION QUALITY CONTROL SUPERVISOR.
    b. Damage and/or defects found during this inspection will be repaired by the GEOSYNTHETICS INSTALLER.
    c. The installation will not be accepted until it meets the requirements of these specifications and any applicable State, Federal or Local Regulations.

B. Installation of the ClosureTurf® system will be accepted by the POR only when the following has been completed:

1. The installation is complete.

2. Seams have been observed and documented by the CQA PERSONNEL and

accepted by the POR.

3. Required independent testing laboratory and field tests have been completed, reviewed and approved.

4. Required GEOSYNTHETICS INSTALLER supplied documentation has been received, reviewed and approved.

5. As built record drawings have been completed and verified by the POR.

6. Any other requirements shown in Section 01 73 19 – 1.04 D CLOSEOUT SUBMITTALS are complete and accepted by the POR.

END OF SECTION

This HydroBinder® Specification document has been prepared to provide the Owner, Design Engineer, Construction Quality Assurance Professional of Record, and the Contractor / Installer with a general guidance specification. All information, recommendations and suggestions appearing in this specification concerning the use of our products are based upon experience, tests and data believed to be reliable; however, this information should not be used or relied upon for any specific application without independent professional examination and verification of its accuracy, suitability and applicability. The independent professional shall edit this document to suit the site specific project design criteria. Since the actual use by others is beyond our control, no guarantee or warranty of any kind, expressed or implied, is made by Watershed Geosynthetics LLC as to the effects of such use or the results to be obtained, nor does Watershed Geosynthetics LLC assume any liability in connection herewith. Any statement made herein may not be absolutely complete since additional information may be necessary or desirable when particular or exceptional conditions or circumstances exist or because of applicable laws or government regulations. PART 2: PRODUCTS

2.01 DESCRIPTION

A. HydroBinder® is a proprietary cementious product used as an alternate infill component of the ClosureTurf® system.

2.02 MATERIALS

A. The infill will be HydroBinder® Cementitious Infill. The infill material may be delivered in either pallet form of 80 lb. bags or 3,000 lb. bulk super sacks.

B. Cement, except as otherwise specified herein, will be a brand of Portland Cement, meeting ASTM C 150 and will be Type I or Type II.

C. Only one brand of cement will be used throughout the duration of this Contract.

D. The cementitious infill mix design will conform to the requirements of ASTM C 387 for high strength mortars.

E. The cementitious infill mix will have a minimum 28 day compressive strength of 5,000 psi per ASTM C 109 / C 109M.

1. Verification of the compressive strength will be completed by the manufacturer and a certified test report supplied with each batch/lot of HydroBinder® material delivered to the site.

PART 3: EXECUTION:

Not Used.

Section 03 49 01 - Alternate HydroBinder® Infill Specification

Section 23 51 23 - ClosureTurf® HDPE Pressure Relief Valve Specification

PART 2: PRODUCTS

2.01 DESCRIPTION

Sand Infill Component of the ClosureTurf® System shall meet the fine aggregate angularity, specific gravity and grain size distribution as specified by WatershedGeo in this Specification.

A. Fine aggregate angularity shall be tested in accordance with ASTM C 1252 / AASHTO T 304, *Standard Test Methods for Uncompacted Void Content of Fine Aggregate (as Influenced by Particle Shape, Surface Texture, and Grading). Method A.* Method A uncompacted void content shall be greater than or equal to 40%.

B. Sand infill specific gravity shall be tested in accordance with ASTM C 128 / AASHTO T 84, *Standard Test Method for Relative Density (Specific Gravity) and Absorption of Fine Aggregate.* Bulk oven-dry specific gravity shall be greater than or equal to 2.40.

C. Sand infill grain size distribution shall be tested in accordance with ASTM C 136 / AASHTO T 27, *Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates.* The grain size distribution shall be as prescribed in Table 1 and presented in Figure 1.

Table 1. Sand Infill Grain Size Distribution

		3/8" (9.5 mm)	≤	100%
90%	≤	#4 (4.75 mm)	≤	100%
50%	≤	#8 (2.36 mm)	≤	85%
25%	≤	#16 (1.18 mm)	≤	65%
10%	≤	#30 (0.60 mm)	≤	45%
0	≤	#50 (0.30 mm)	≤	30%
0	≤	#100 (0.15 mm)	≤	10%
0	≤	#200 (0.075 mm)	≤	5%

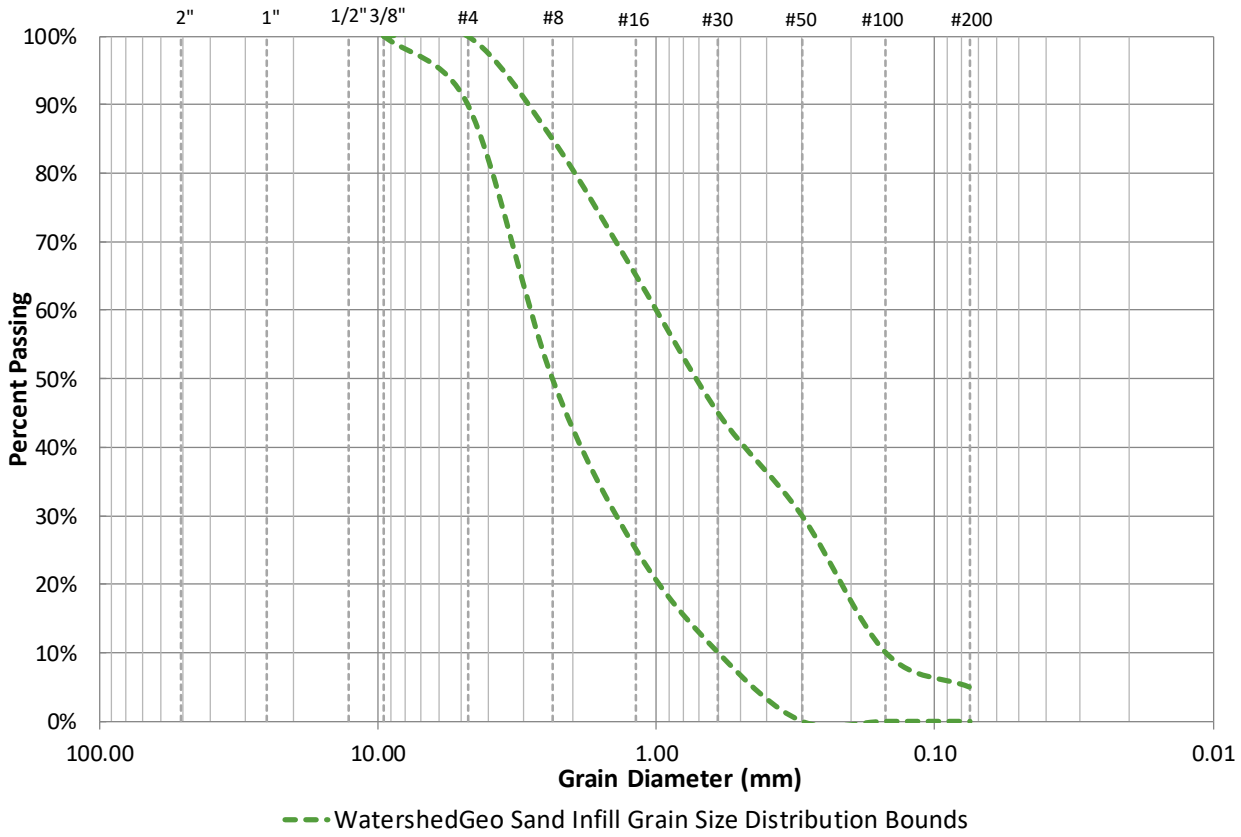

Figure 1: ClosureTurf® Specified Infill Grain Size Distribution

D. Documentation of sand infill conformance with ASTM C 136 / AASHTO T 27, ASTM C 128 / AASHTO T 84 and ASTM C 1252 / AASHTO T 304 shall be submitted to the specified CQA personnel.

E. Subsequent to initial verification of specification conformance, sand infill shall have grain size distribution conformance verified and documented for each 175 cubic yards to be installed.

PART 3: EXECUTION:

Not Used. See Section 01 73 19 ClosureTurf® Installation Specifications.

PART 3: EXECUTION:

3.01 EXAMINATION

A. Evaluation and Assessment:

Responsibilities for the approval and maintenance of the subgrade are as follows:

1. OWNER'S REPRESENTATIVE:
   a. Verify in writing that the surface on which the geomembrane component will be installed is acceptable.
2. GEOSYNTHETICS INSTALLER:
   a. Keep the accepted subgrade surface in a condition conducive to the deployment of all ClosureTurf® components.
   b. Subgrade acceptance is determined when the deployment of the geomembrane component begins.
   c. Maintain the previously accepted subgrade.
   d. Identify any part of the subgrade that becomes non-compliant to the specifications during the course of construction.
   e. Timely submission to the OWNER'S REPRESENTATIVE of subgrade acceptance certificates.

3.02 PREPARATION

A. Surface Preparation:
   1. Subgrade will be substantially smooth, uniform, firm and free from rocks or other debris.
   2. No rocks or protrusions greater than 1 inch in diameter will be exposed

at the subgrade surface.

3. Approved subgrade to be capable of supporting the weight of geosynthetics installation equipment.
4. Daily evaluation to show no changes have occurred that would render the subgrade unacceptable.

B. Non-Conforming Work

1. Subgrade not meeting specifications either before or during deployment of the ClosureTurf® components will be reported to the OWNER'S REPRESENTATIVE and corrected as required.

Super Gripnet® Liner

LINEAR LOW DENSITY POLYETHYLENE

AGRU America's structured geomembranes are manufactured on state-of-the-art manufacturing equipment using the flat die calender manufacturing process, a method that produces a more consistent core thickness than other processes, such as the blown film extrusion process. AGRU uses only the highest-grade HDPE and LLDPE resins manufactured in North America.

Job	Big Rivers Wilson Landfill	Project No.	60631499	Sheet	1 of 5
Description	Attachment E: Hydrology Evaluation	Computed by	NN	Date	11/19/20
		Checked by	FS	Date	11/19/20

I. PURPOSE

The purpose of this attachment is to design and analyze the surface water controls for Big Rivers Electric Corporation's Wilson Fossil Plant in consistent with 401 KAR 45:110 Rule[1]..

II. SITE AND PROJECT DESCRIPTION

The surface water control design was performed as part of the closure plan for the landfill facility at Big Rivers Wilson plant in Island, Kentucky. Refer to Figure 1 for a depiction of the stormwater features (i.e., ponds, flumes, terraces, and perimeter ditches) in relation to the landfill.

The following sections summarize the design criteria, procedure, assumptions, and results of the stormwater features design.

III. PROCEDURE

Design of the landfill site stormwater features was an iterative process beginning with basic assumptions and a proposed grading plan for the site. The hydraulic features of the stormwater ponds, stormwater flumes, and perimeter ditches were initially assumed and then confirmed through multiple iterations.

The AutoCAD Civil 3D software package was used to generate the proposed site grading plan and subsequently to determine drainage areas, volumes, and other site geometries (Attachment **H**). SWMM (version 5.1) modeling software was used to conduct the hydrologic and hydraulic calculations for this analysis with inputs based on the site geometry, rainfall data, and other design assumptions. (Attachment E2)

The model was used to generate surface water volumes and peak water surface elevations in the basins and to generate velocities, and water surface elevations at the outlets of the benches, stormwater flumes, and perimeter ditches for one design storm condition (i.e., 24-hour, 25-year storm) and based on upstream watershed features of the site and the drainage facilities design parameters. The proposed drainage system will pass all flows equal to and lesser than those generated by the 24-hour, 25-year storm.

The rainfall depths for Island, Kentucky of 5.90 inches for the 24-hour, 25-year storm was obtained from NOAA Atlas 14 located at http://hdsc.nws.noaa.gov/hdsc/pfds/ and are included as Attachment E1.

[1] Kentucky Administrative Regulations: Technical and Operating Requirements for Special Waste Landfills: Section 401 KAR 45:110

The shear stress was also calculated for each channel reach (bench/flume/ditch) to confirm the type of channel lining selected. Actual shear stress was calculated by the following equation:

$\tau ac = 62.4 * D * S$

where,

D = water surface depth, ft

S = channel slope, ft/ft

τac = Actual shear stress, lbs/ft^2

IV. SUMMARY OF RESULTS

a. Stormwater Ponds

The results of the stormwater ponds design are summarized in Table 1. The results of the SWMM modeling for three ponds are provided in Attachment E2. The three ponds detain the water volume generated by the 24-hour, 25-year storm and the discharge outlets are sized appropriately such that the peak water surface elevation in the ponds during the 24-hour, 25-year storm remains safely below the peak storage elevation of the ponds.

b. Culverts

A summary of culverts is presented in Table 2. The results of the culverts design show that the objectives have been met (see also Attachment E2 for associated SWMM output reports). The structures properly control and convey the water volume generated by the 24-hour, 25-year storm such that the peak water surface elevation immediately upstream remains safely below the impounding side slopes.

c. Perimeter Ditches

The results of the channels design are summarized in Table 3 (see also Attachment E2 for the SWMM output report). The channels properly control and convey the water volume generated by the 24-hour, 25-year storm such that the peak water surface elevation stays safely below the impounding side slopes. These are the perimeter channels collecting landfill run-off which is conveyed to the sediment basins. A channel lining of ClosureTurf with HydroBinder was chosen for all perimeter and conveyance channels as the peak velocity ranged from 2 to 11 fps and the actual shear stress ranged from 0.1to 2.7 lbs/ft^2.

d. Stormwater Flumes

The results of the stormwater flumes design are summarized in Table 4 (see also Attachment E2 for the SWMM output report). The flumes properly control and convey the water volume generated by the 24-hour, 25-year storm such that the average flow depth stays safely below the impounding side slopes. A channel lining of ClosureTurf with HydroBinder (manning n = 0.02, and shear stress = 8.8 lb/ft^2)[2] was chosen for all flumes as the peak velocity ranged from 8 to 20 fps and the actual shear stress ranged from 1.6 to 8.7 lbs/ft^2.

e. Benches/ Terraces

A select number of presumed worst-case terraces were modeled based on drainage area/length and channel slope. The results of the terrace design are summarized in Table 5 (see also Attachment E2 for the SWMM output report). The terraces properly control and convey the water volume generated by the 24-hour, 25-year storm such that the average flow depth stays safely below the impounding side slopes. A channel lining of KYTC No. 57 (manning n = 0.039, and shear stress = 5.0 lb/ft^2)[3] was chosen for all terraces as the peak velocity ranged from 1 to 3 fps and the actual shear stress ranged from 0.1 to 1.2 lbs/ft^2.

V. CONCLUSIONS

The proposed grading of the landfill and stormwater ponds in combination with the design of the channels and culverts as presented above is sufficient to safely control and convey the 24-hour, 25-year storm. Appropriate outlet protection riprap has been selected for each culvert based on regulatory guidance. The check dams would be appropriate and recommended for this site. Refer to accompanying calculations used to design upstream conveyance features (storm water terraces, perimeter channels, and culverts) entering the basins.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

Sand Infill Hydraulic Stability Calculations

Sand Infill Hydraulic Stability Calculations
Big Rivers Generating Station

Sand infill hydraulic stability in ClosureTurf® has been independently tested by the third-party laboratory, TRI Environmental. A summary of testing and results is provided as Attachment 1. The current ClosureTurf sand infill specification is provided as Attachment 2. Test results demonstrate minimal sand infill mobilization at hydraulic shear values exceeding 1.5 lb/ft^2. The suggested design value for evaluating the potential for infill mobilization is 0.8 lb/ft^2.

Calculations utilizing site specific parameters to estimate hydraulic shear from rainfall runoff are provided. The purpose of the calculations is to evaluate whether the calculated maximum hydraulic shear stress in the sand infill of ClosureTurf exceeds the critical hydraulic shear stress. Three drainage scenarios are evaluated in the following calculations based on the information provided to Watershed Geo by the design engineer. The calculation results are summarized in Table 1 below.

Table 1. Summary of calculation results

Analysis Scenario	Calculated Max. Hydraulic Shear Stress using Super Gripnet® on Top Deck (psf)	Calculated Max. Hydraulic Shear Stress using Super Gripnet® on Side Slope (psf)	Suggested Critical Hydraulic Shear Stress (psf)	Hydraulic Shear Stress (Pass or Fail)
Scenario 1: 55 ft of top deck at 5% slope and 68 ft of side slope at 3.25H:1V	0.0 (Total flow on the top deck is less than the internal drainage capacity of Super Gripnet)	0.0 (Total flow on the slope is less than the internal drainage capacity of Super Gripnet)	0.8	Pass
Scenario 2: 156 ft of side slope at 3.4H:1V	-	0.0 (Total flow on the slope is less than the internal drainage capacity of Super Gripnet)		Pass
Scenario 3: 365 ft of side slope at 6H:1V	-	0.26		Pass

Scenario 1 – 55 ft of Top Deck into 68 ft of Side Slope

The maximum drainage path under Scenario 1 consists of a top deck with an assumed 5% slope with a drainage length of approximately 55 ft that then continues onto a 3.25H:1V side slope with a drainage length of approximately 68 ft.

Design Parameters:

Top Deck:

- Drainage length: L_1 = 55 ft (see Figure 1)
- Slope: S_1 = 5%
- Slope angle: $\alpha_1 = \tan^{-1}(5/100) = 2.86°$
- Hydraulic gradient: i_1 = 5% or 0.05
- Manning's roughness coefficient: n_1 = 0.22 (for slope $\leq$ 10%; See Watershed Geo's ClosureTurf Design Manual)
- Geomembrane type: Super Gripnet (with internal drainage layer)
- Transmissivity of ClosureTurf with Super Gripnet (use the data in Figure 3, the ClosureTurf transmissivity test report by SGI to calculate the transmissivity at the slope of 5% or i = 0.05):
  - Flow Rate: $q = 12.28 \times i^{0.624} = 12.28 \times 0.05^{0.624} = 1.89\ gpm/ft$
  - Transmissivity: $\theta_{i=0.05} = 0.00020697 \times \frac{q}{i} = 0.00020697 \times \frac{1.89}{0.05} = 7.82 \times 10^{-3}\ m^2/sec$

Side Slope:

- Drainage length: L_2 = 68 ft (see Figure 1)
- Slope: S_2 = 30.8% (3.25H:1V)
- Slope angle: $\alpha_2 = \tan^{-1}(1/3.25) = 17.1°$
- Hydraulic gradient: i_2 = 30.8% or 0.308
- Manning's roughness coefficient: n_2 = 0.12 (for slope > 10%; See Watershed Geo's ClosureTurf Design Manual)
- Geomembrane type: Super Gripnet (with internal drainage layer)
- Transmissivity of ClosureTurf with Super Gripnet (use the data in Figure 3, the ClosureTurf transmissivity test report by SGI to calculate the transmissivity at the slope of 3.25H:1V or i = 0.308):
  - Flow Rate: $q = 12.28 \times i^{0.624} = 12.28 \times 0.308^{0.624} = 5.89\ gpm/ft$
  - Transmissivity: $\theta_{i=0.308} = 0.00020697 \times \frac{q}{i} = 0.00020697 \times \frac{5.89}{0.308} = 3.96 \times 10^{-3}\ m^2/sec$

Other Design Parameters:

- Design rain fall intensity (see Figure 2, the 25-yr, 1-hr in NOAA precipitation data):

$$R = 2.35\frac{in}{hr} = 0.196\frac{ft}{hr}$$

- Critical hydraulic shear stress of ClosureTurf with manufactured sand infill:

τ_C = 0.8 psf (see Attachment 1)

Step 1: Calculate the maximum hydraulic shear stress of flow on the top deck

Flow rate on the top deck under the design rainfall intensity (assuming unit width of 1 ft of final cover):

$$q_1 = L_1 \cdot R \cdot \cos\alpha_1 = 55ft \times 0.196\frac{ft}{hr} \times \cos 2.86° = 10.76\frac{ft^2}{hr} = 0.0029\frac{ft^2}{s}$$

Part of the flow is expected to be through the internal drainage channel of the Super Gripnet (i.e., the space within the drainage studs of Super Gripnet). The internal flow capacity of ClosureTurf with Super Gripnet is:

$$q_{int} = \theta_{i=0.05} \cdot i_1 = 7.82 \times 10^{-3}\frac{m^2}{sec} \times 0.05$$
$$= 7.82 \times 10^{-3} \times \frac{(3.28ft)^2}{\left(\frac{1}{3600}\right)hr} \times 0.05 = 15.14\frac{ft^2}{hr}$$

The remaining flow will be through the turf and sand infill:

$$q_1' = q_1 - q_{int} = 10.76\frac{ft^2}{hr} - 15.14\frac{ft^2}{hr} = -4.38\frac{ft^2}{hr} < 0$$

Because the internal drainage capacity of Super Gripnet is greater than the flow rate, no water is expected to flow within the sand infill layer. Therefore, the hydraulic shear stress in the sand infill is zero and no erosion of sand infill is expected to occur.

Step 2: Calculate the maximum hydraulic shear stress of flow on the side slope

Water from the top deck will continue to flow onto the side slope. The total flow at the end of the side slope is:

$$q_{total} = q_1 + q_2 = q_1 + L_2 \cdot R \cdot \cos\alpha_2 = 10.76\frac{ft^2}{hr} + \left(68ft \times 0.196\frac{ft}{hr} \times \cos 17.1°\right)$$
$$= 23.49\frac{ft^2}{hr} = 0.0065\frac{ft^2}{s}$$

Part of the flow is expected to be through the internal drainage channel of the Super Gripnet (i.e., the space within the drainage studs of Super Gripnet). The internal flow capacity of ClosureTurf with Super Gripnet is:

$$q_{int} = \theta_{i=0.308} \cdot i_2 = 3.96 \times 10^{-3}\frac{m^2}{sec} \times 0.308$$

$$= 3.96 \times 10^{-3} \times \frac{(3.28ft)^2}{\left(\frac{1}{3600}\right)hr} \times 0.308 = 47.24 \frac{ft^2}{hr}$$

The remaining flow will be through the turf and sand infill:

$$q'_{total} = q_{total} - q_{int} = 23.49 \frac{ft^2}{hr} - 47.24 \frac{ft^2}{hr} = -23.75 \frac{ft^2}{hr} < 0$$

Because the internal drainage capacity of Super Gripnet is greater than the flow rate, no water is expected to flow within the sand infill layer. Therefore, the hydraulic shear stress in the sand infill is zero and minimal sand infill mobilization is expected to occur.

Scenario 2 – 156 ft of Side Slope at 3.4H:1V

The maximum drainage path under Scenario 2 consists of a side slope with a 3.4H:1V slope and a drainage length of approximately 156 ft that does not receive flow from a top deck.

Design Parameters:

Side Slope:

- Drainage length: L_1 = 156 ft (See Figure 1)
- Slope: S_1 = 29.4% (3.4H:1V)
- Slope angle: $\alpha_1 = \tan^{-1}(1/3.4) = 16.4°$
- Hydraulic gradient: i_1 = 29.4% or 0.294
- Manning's roughness coefficient: n_1 = 0.12 (for slope > 10%; See Watershed Geo's ClosureTurf Design Manual)
- Geomembrane type: Super Gripnet (with internal drainage layer)
- Transmissivity of ClosureTurf with Super Gripnet (use the data in Figure 3, the ClosureTurf transmissivity test report by SGI to calculate the transmissivity at the slope of 29.4% or i = 0.294):
  - Flow Rate: $q = 12.28 \times i^{0.624} = 12.28 \times 0.294^{0.624} = 5.72\ gpm/ft$
  - Transmissivity: $\theta_{i=0.294} = 0.00020697 \times \frac{q}{i} = 0.00020697 \times \frac{5.72}{0.294} = 4.03 \times 10^{-3}\ m^2/sec$

Other Design Parameters:

- Design rain fall intensity (see Figure 2, the 25-yr, 1-hr in NOAA precipitation data):

$$R = 2.35\frac{in}{hr} = 0.196\frac{ft}{hr}$$

  Critical hydraulic shear stress of ClosureTurf with manufactured sand infill: $\tau_C = 0.8\ psf$ (see Attachment 1)

Step 1: Calculate the maximum hydraulic shear stress of flow on the slope

Flow rate on the slope under the design rainfall intensity (assuming unit width of 1 ft of final cover):

$$q_1 = L_1 \cdot R \cdot \cos\alpha_1 = 156ft \times 0.196\frac{ft}{hr} \times \cos 16.4° = 29.33\frac{ft^2}{hr} = 0.0081\frac{ft^2}{s}$$

Part of the flow is expected to be through the internal drainage channel of the Super Gripnet (i.e., the space within the drainage studs of Super Gripnet). The internal flow capacity of ClosureTurf with Super Gripnet is:

$$q_{int} = \theta_{i=0.294} \cdot i_1 = 4.03 \times 10^{-3}\frac{m^2}{sec} \times 0.294$$

$$= 4.03 \times 10^{-3} \times \frac{(3.28ft)^2}{\left(\frac{1}{3600}\right)hr} \times 0.294 = 45.89 \frac{ft^2}{hr}$$

The remaining flow will be through the turf and sand infill:

$$q_1' = q_1 - q_{int} = 29.33 \frac{ft^2}{hr} - 45.89 \frac{ft^2}{hr} = -16.56 \frac{ft^2}{hr} < 0$$

Because the internal drainage capacity of Super Gripnet is greater than the flow rate, no water is expected to flow within the sand infill layer. Therefore, the hydraulic shear stress in the sand infill is zero and minimal sand infill mobilization is expected to occur.

Scenario 3 – 365 ft of Side Slope at 6H:1V

The maximum drainage path under Scenario 3 consists of a side slope with a 6H:1V slope and a drainage length of approximately 365 ft that does not receive flow from a top deck.

Design Parameters:

Side Slope:

- Drainage length: L_1 = 365 ft (See Figure 1)
- Slope: S_1 = 16.7% (6H:1V)
- Slope angle: $\alpha_1 = \tan^{-1}(1/6) = 9.46°$
- Hydraulic gradient: i_1 = 16.7% or 0.167
- Manning's roughness coefficient: n_1 = 0.12 (for slope > 10%; See Watershed Geo's ClosureTurf Design Manual)
- Geomembrane type: Super Gripnet (with internal drainage layer)
- Transmissivity of ClosureTurf with Super Gripnet (use the data in Figure 3, the ClosureTurf transmissivity test report by SGI to calculate the transmissivity at the slope of 16.7% or i = 0.167):
  - Flow Rate: $q = 12.28 \times i^{0.624} = 12.28 \times 0.167^{0.624} = 4.02\ gpm/ft$
  - Transmissivity: $\theta_{i=0.167} = 0.00020697 \times \frac{q}{i} = 0.00020697 \times \frac{4.02}{0.167} = 4.98 \times 10^{-3}\ m^2/sec$

Other Design Parameters:

- Design rain fall intensity (see Figure 2, the 25-yr, 1-hr in NOAA precipitation data):
$$R = 2.35\frac{in}{hr} = 0.196\frac{ft}{hr}$$
- Critical hydraulic shear stress of ClosureTurf with manufactured sand infill: $\tau_C = 0.8\ psf$ (see Attachment 1)

Step 1: Calculate the maximum hydraulic shear stress of flow on the slope

Flow rate on the slope under the design rainfall intensity (assuming unit width of 1 ft of final cover):

$$q_1 = L_1 \cdot R \cdot \cos\alpha_1 = 365ft \times 0.196\frac{ft}{hr} \times \cos 9.46° = 70.56\frac{ft^2}{hr} = 0.0196\frac{ft^2}{s}$$

Part of the flow is expected to be through the internal drainage channel of the Super Gripnet (i.e., the space within the drainage studs of Super Gripnet). The internal flow capacity of ClosureTurf with Super Gripnet is:

$$q_{int} = \theta_{i=0.167} \cdot i_1 = 4.98 \times 10^{-3}\frac{m^2}{sec} \times 0.167$$

$$= 4.98 \times 10^{-3} \times \frac{(3.28ft)^2}{\left(\frac{1}{3600}\right)hr} \times 0.167 = 32.21\frac{ft^2}{hr}$$

The remaining flow will be through the turf and sand infill:

$$q_1' = q_1 - q_{int} = 70.56\frac{ft^2}{hr} - 32.21\frac{ft^2}{hr} = 38.35\frac{ft^2}{hr} = 0.0106\frac{ft^2}{s}$$

The flow rate:

$$q_1' = v_1 \cdot A_1 = v_1 \cdot (H_1 \times 1\,ft) = v_1 \cdot H_1$$

Where, H_1 is flow depth on the slope (ft). Using the Manning's Equation and assuming the hydraulic radius equals to the flow depth (in ft):

$$v_1 = \frac{1.49}{n_1} H_1^{\frac{2}{3}} \sqrt{S_1}$$

Therefore,

$$q_1' = v_1 \cdot H_1 = \frac{1.49}{n_1} H_1^{\frac{2}{3}} \sqrt{S_1} \cdot H_1 = \frac{1.49}{n} H_1^{\frac{5}{3}} \sqrt{S_1}$$

Solve the above equation for H_1,

$$H_1 = \left(\frac{q_1' \cdot n_1}{1.49 \cdot \sqrt{S_1}}\right)^{\frac{3}{5}} = \left(\frac{0.0106 \times 0.12}{1.49 \cdot \sqrt{0.167}}\right)^{\frac{3}{5}} = 0.025ft$$

The maximum hydraulic shear stress by the water flow on slope:

$$\tau_1 = \gamma_w \cdot H_1 \cdot S_1 = 62.4\frac{lb}{ft^3} \times 0.025\,ft \times 0.167 = 0.26\,psf < \tau_c = 0.8\,psf, \textbf{PASS}!$$

The calculated maximum hydraulic shear stress in the sand infill is less than the critical hydraulic shear stress, indicating minimal sand infill mobilization is expected to occur.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Evaluation of Sand Infill Criteria for ClosureTurf®

Watershed Geo®
Unearthing Solutions

Technical Note

EVALUATION OF SAND INFILL CRITERIA FOR CLOSURETURF®

Fine aggregate infill (sand) is one component of the ClosureTurf® three component system. An extensive testing program was implemented to evaluate the criteria and performance properties for the sand infill in the ClosureTurf system. The program included large scale performance testing by an independent third party laboratory, TRI Environmental (TRI) at the Denver Downs Research facility in Greeneville, South Carolina. A description of the testing procedures and results are provided in this document.

SAND INFILL FUNCTION

The sand infill component of ClosureTurf is utilized as a protective layer for the geotextile backing of the engineered turf component. The polypropylene geotextile backing material contains ultraviolet (UV) radiation degradation inhibitors protecting it against UV damage. Sand infill functions as an additional protective layer against UV degradation of the geotextile backing. Optimal sand infill performance occurs with minimal sand movement.

TRI tested sand infill mobilization in ClosureTurf in general accordance with ASTM D 6460, *Standard Test Method for Determination of Rolled Erosion Control Product (RECP) Performance in Protecting Earthen Channels from Stormwater-Induced Erosion* and ASTM D 6459 *Standard Test Method for Determination of Rolled Erosion Control Product (RECP) Performance in Protecting Hillslopes from Rainfall-Induced Erosion*. The results of the testing were also analyzed in accordance with each Standard to quantify infill mobilization during tested conditions. Photographs of tested sands are provided as Attachment A.

SAND INFILL LARGE SCALE HYDRAULICS TESTING

The TRI large-scale hydraulic testing (ASTM D 6460) was conducted in a rectangular flume having a 0.10 ft/ft slope. The subgrade was a loamy soil over which ClosureTurf with a ½ inch sand infill was installed following installation guidelines. Water is supplied to the facility by gravity flow and controlled and measured through upstream sluice gates as presented in Figure 1.

A test consists of measuring infill thickness, opening the sluice gates a predetermined amount allowing overtopping flow on the ClosureTurf for a period of 30 minutes, closing the sluice gate to stop overtopping flow and measuring infill depth to evaluate sand loss. The test procedure is repeated a minimum of four times with increasing overtopping flow amounts or until enough sand infill has been removed to expose the majority of the geotextile backing.

Figure 1. ClosureTurf® TRI Flume Test Installation

Reported test results include sand infill loss during each 30-minute overtopping period and the corresponding hydraulic shear stress during the 30-minute test period. The testing was conducted on six different sand infills having a range of grain size distributions, fine aggregate angularities and specific gravities. Sand infill angularity and specific gravity are presented in Table 1. Tested sand infill grain size distributions are presented in Figure 2. Hydraulic shear stress results are presented in Figure 3.

Table 1. Tested Sand Infill Angularity and Specific Gravity

Test Sand No.	Fine Aggregate Angularity (FAA) (%) (ASTM C 1252 / AASHTO T 304) (Method A)	Bulk Specific Gravity, Dry (SG) (ASTM C 128 / AASHTO T 84)
1	47.2	2.64
2	40.5	2.60
3	43.1	2.59
4	45.7	2.64
5	47.1	2.85

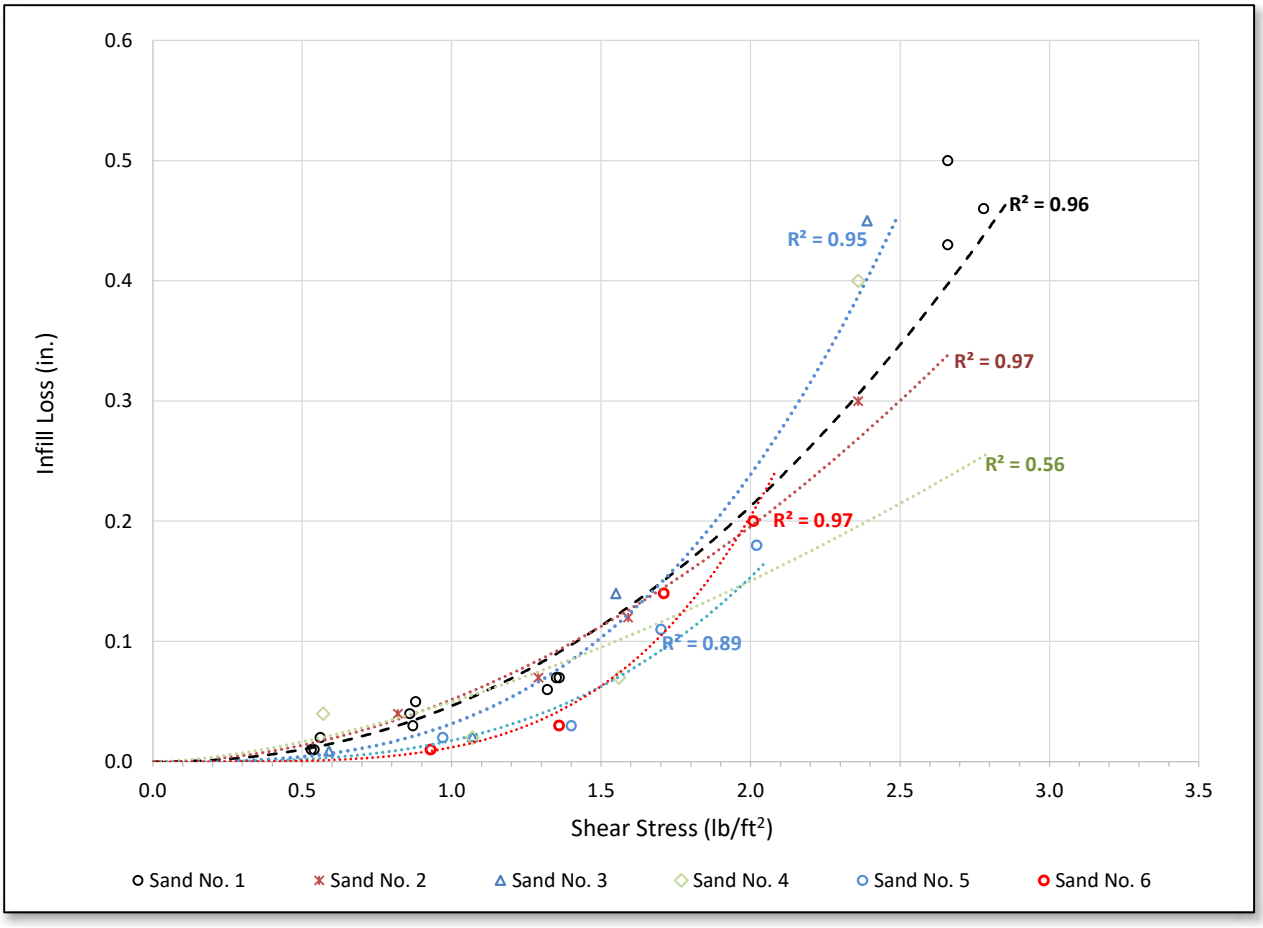

Figure 3. Infill Loss Due to Hydraulic Shear

SAND INFILL LARGE SCALE RAINFALL EROSION TESTING

The TRI large-scale rainfall erosion testing (ASTM D 6459) was conducted on a rectangular plot measuring 40 feet by 8 feet (length x width) and having a 0.33 ft/ft slope. The subgrade was a loamy soil over which ClosureTurf with a ½ inch sand infill was installed following installation guidelines as presented in Figure 4a. Artificial rainfall is produced by ten "rain trees" arranged around the perimeter of the test slope. Each rain tree has four sprinkler heads atop a 15 ft. riser pipe. The rainfall system produces target rainfall intensities of 2-, 4-and 6-inches per hour at pre-calibrated rain drop size distributions for a period of 20 minutes per intensity resulting in a one hour test. Testing in progress is presented in Figure 4b. All runoff was collected during testing to quantify sediment mobilization. Incremental infill losses are presented in Table 2.

PART 2: PRODUCTS

2.01 DESCRIPTION

Sand Infill Component of the ClosureTurf® System shall meet the fine aggregate angularity, specific gravity and grain size distribution as specified by WatershedGeo in this Specification.

A. Fine aggregate angularity shall be tested in accordance with ASTM C 1252 / AASHTO T 304, *Standard Test Methods for Uncompacted Void Content of Fine Aggregate (as Influenced by Particle Shape, Surface Texture, and Grading). Method A.* Method A uncompacted void content shall be greater than or equal to 40%.

B. Sand infill specific gravity shall be tested in accordance with ASTM C 128 / AASHTO T 84, *Standard Test Method for Relative Density (Specific Gravity) and Absorption of Fine Aggregate.* Bulk oven-dry specific gravity shall be greater than or equal to 2.40.

C. Sand infill grain size distribution shall be tested in accordance with ASTM C 136 / AASHTO T 27, *Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates.* The grain size distribution shall be as prescribed in Table 1 and presented in Figure 1.

Table 1. Sand Infill Grain Size Distribution

		3/8" (9.5 mm)	≤	100%
90%	≤	#4 (4.75 mm)	≤	100%
50%	≤	#8 (2.36 mm)	≤	85%
25%	≤	#16 (1.18 mm)	≤	65%
10%	≤	#30 (0.60 mm)	≤	45%
0	≤	#50 (0.30 mm)	≤	30%
0	≤	#100 (0.15 mm)	≤	10%
0	≤	#200 (0.075 mm)	≤	5%

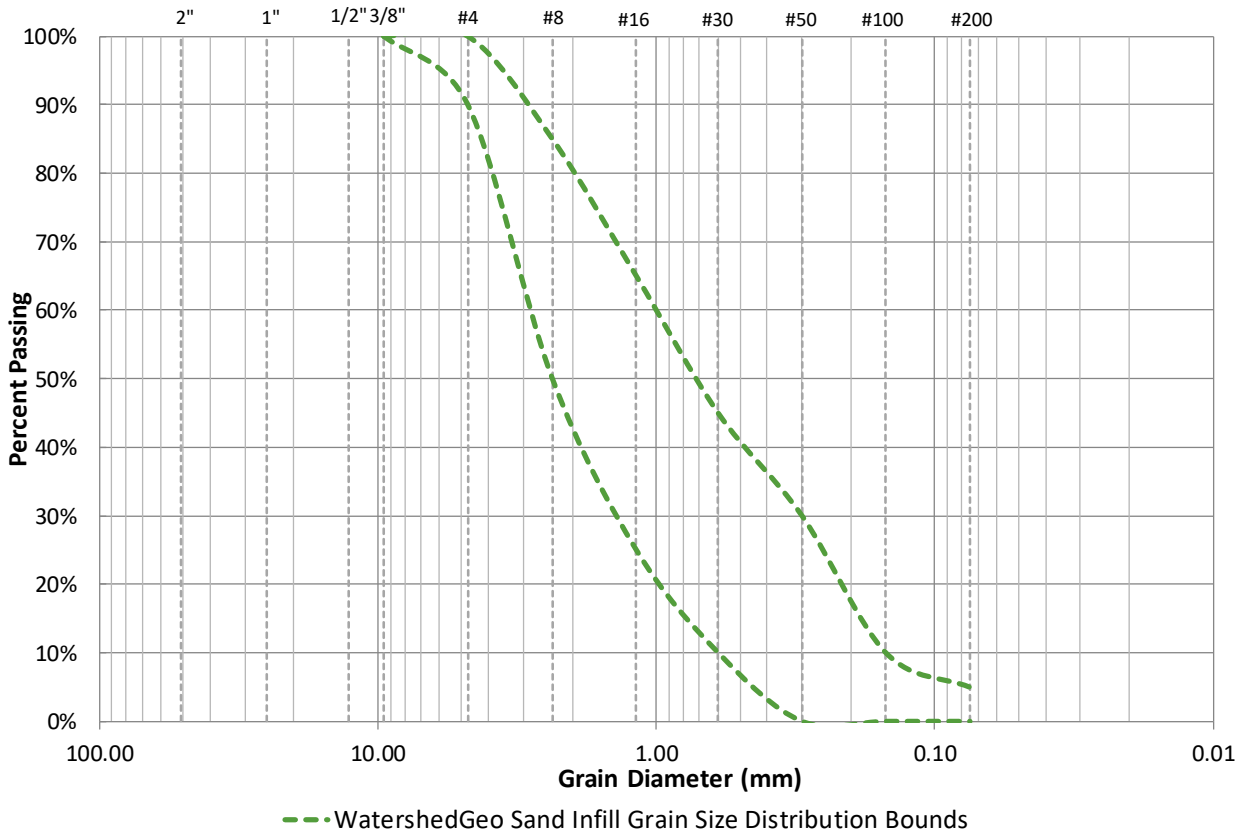

Figure 1: ClosureTurf® Specified Infill Grain Size Distribution

D. Documentation of sand infill conformance with ASTM C 136 / AASHTO T 27, ASTM C 128 / AASHTO T 84 and ASTM C 1252 / AASHTO T 304 shall be submitted to the specified CQA personnel.

E. Subsequent to initial verification of specification conformance, sand infill shall have grain size distribution conformance verified and documented for each 175 cubic yards to be installed.

PART 3: EXECUTION:

Not Used. See Section 01 73 19 ClosureTurf® Installation Specifications.

ClosureTurf® Overview

Superior Performance When Compared to EPA Subtitle D Final Closure Design

Watershed Geosynthetics, LLC has prepared this document to define the range of benefits of using ClosureTurf® as a final cover system for EPA Subtitle D applications. ClosureTurf offers several substantial performance benefits and environmental benefits over traditional and regulatory prescriptive designs for final closure of landfills and/or impoundments.

ClosureTurf provides significant technical advantages as a final closure system in comparison with the traditional EPA Subtitle D soil and vegetative cover treatment. Those benefits have been validated through extensive documented laboratory testing conducted at leading independent and existing operating facilities.

ClosureTurf is a more environmentally sound application when compared to traditional soil and vegetative covers. Some of these include improved water quality, land preservation and significant carbon footprint reduction. These environmental advantages are both quantifiable and effective.

As presented below, the regulatory criteria for evaluating an alternative cover system is to control infiltration and erosion. Based on several years of real world experience on over 40 million square feet installed, and extensive university and ASTM lab evaluations, the ClosureTurf system has shown to have a leakage rate over 40 times less than subtitle D prescriptive cover and an erosion loss of over 100 times less than subtitle D prescriptive cover.

ClosureTurf® Benefits

1) Regulatory Compliance

ClosureTurf is a three-component system comprised of a structured geomembrane, engineered synthetic turf, and a specified infill that meets and/or exceeds all of the requirements set forth by the EPA in "Subtitle D". EPA Subtitle D rules specifically state: "An alternative cover design may be used as long as it provides equivalent protection against infiltration and erosion." ClosureTurf significantly outperforms traditional Subtitle D closures based on these criteria, with the added benefit of performance well beyond the regulatory post-closure period.

2) Safety and Community Impact Reduction

The system eliminates approximately 550 truck trips per acre (1 load = 2 trips) from local roadways that would otherwise be used transporting soil to and from a borrow site. This reduction in size, number and duration of equipment means an overall increase in safety on both the project site and ingress and egress, while reducing dust, mud on roads and noise impacts to the surrounding community. Most traditional closures also require destruction of land in the community for project soil demands, resulting in secondary impacts and loss of future land use.

3) Sustainability

ClosureTurf® reduces the carbon footprint of a closure by approximately 80% when compared with traditional soil/vegetative covers. In addition, ClosureTurf provides an ideal foundation for future beneficial uses. Traditional post-closure plans identify the post-closure use simply as dead space. Note that ClosureTurf has been used for post-closure uses such photovoltaic solar panel arrays, allowing what is typically written off as "dead space" to be utilized as a renewable energy site. This feature is inherent with the ClosureTurf system and requires no special preparation or planning to accommodate possible future solar use.

4) Water Quality

The engineered synthetic turf and specified infill effectively filters surface water, providing clean runoff with very low turbidity. In addition, the system significantly reduces sediment loading to surrounding channels and sedimentation/detention basins both on and offsite. ClosureTurf will have a positive impact on overall storm water quality for sites, allowing them to improve their effluent levels to meet or be well below the regulatory limits.

5) Geotechnical Factors of Safety

ClosureTurf provides additional benefit through increased geotechnical factors of safety on the cover system. On side slopes, these factors of safety provide increased protection from sloughing and veneer failures under both static and seismic conditions. On flat surfaces (i.e. top decks), these increased factors of safety are realized through a significant reduction in the soil layer and subsequent loading of any underlying sludge-type waste materials that can reverse drainage and create ponding.

6) Water Conservation

ClosureTurf is a very low maintenance final cover system, eliminating the need of costly re-vegetating and fertilizing of traditional soil/vegetative covers and reducing the evaporative losses and water demands to sustain the closure and its performance. In addition, the system inhibits dust-creation, eliminating the need for wasteful watering practices intended to reduce dust transmission and air particulate pollution.

7) Maintenance Cost Savings

ClosureTurf effectively reduces the maintenance of a final closure system by over 90% through the elimination of maintenance activities and typical erosion repair issues associated with traditional vegetative covers. This savings continues to pay dividends year after year and protects the site from drought cycle or other severe weather damage that can have a detrimental effect on vegetative covers.

8) Land Conservation

Traditional closure methods require the destruction of land to achieve the closure. ClosureTurf optimizes land conservation through the elimination of excavation borrow pits on undisturbed, native land as well as providing acreage for renewable energy sites (i.e. photovoltaic solar panel arrays) that might otherwise need to be constructed in other undeveloped areas.

9) Project Schedule/Installation Rate

ClosureTurf® requires fewer resources to complete a final cover closure, from pre-design through final acceptance. ClosureTurf installs significantly faster than traditional soil covers using dramatically lighter and fewer pieces of equipment. This increase in project-completion efficiency means that owners, operators and their design and construction team can cover more acreage far more effectively with ClosureTurf than with traditional soil cover systems. In addition, the standardization of engineering and construction details associated with ClosureTurf reduces the burden on the regulatory review and approval process.

10) Longevity

The system is designed for and proven to have a design life over 100 years of the infilled geosynthetic protective layer (Engineered Synthetic Turf) of ClosureTurf (with the underlying geomembrane lasting many more years beyond the long life of the Engineered Turf component).

ClosureTurf® Detail Description

ClosureTurf is an environmentally friendly and aesthetically pleasing synthetic turf final cover system designed for long-term performance with a protective erosion layer for the structured membrane. This system eliminates the challenges of traditional vegetative cover systems such as erosion control, veneer slope stability, and post- closure maintenance. A section of ClosureTurf is shown in Figure 1. Its components include the following from bottom to top:

- Structured HDPE or LLDPE Geomembrane;
- Engineered Synthetic Turf (Comprised of Polyethylene Fibers Tufted through a Double Layer of Woven Polypropylene Geotextiles manufactured for high UV and heat resistance);and
- Specified Infill.

The ClosureTurf system is placed directly on top of the prepared subgrade.

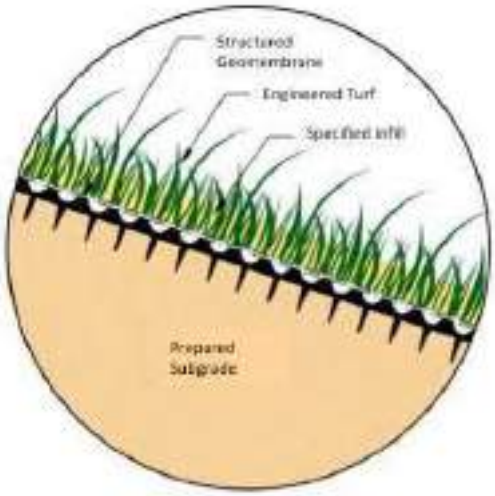

Figure 1 – Cross Section of ClosureTurf® System

ClosureTurf® has been approved as a Final Cover System in many states across the U.S. Approvals were based on a demonstration that ClosureTurf exceeds the minimum requirements defined in applicable state or Federal EPA regulations.

The minimum technical requirements for Subtitle D Final Cover Systems are contained in 40 CFR 258.60. This regulation allows for a prescriptive (minimum criteria) cover system or an alternative (performance based) cover system. The specific requirements of 40 CFR 258.60 for approval of an alternative final cover system are as follows:

"(B) The Director of an approved State may approve an alternative final cover design that includes:

(1) An infiltration layer that achieves an equivalent reduction in infiltration as the infiltration layer specified in paragraphs (a) (1) and (a) (2) of this section, and

(2) An erosion layer that provides equivalent protection from wind and water erosion as the erosion layer specified in paragraph (a) (3) of this section."

The analyses demonstrate that the ClosureTurf Final Cover System has (1) a greater reduction in infiltration than the Prescriptive Subtitle D Cover and (2) provides greater protection from erosion, while providing several orders of magnitude of functional longevity with reduced maintenance burden. The regulatory approvals, testing and real-world experience has been demonstrated at multiple closures having varying climate conditions as shown in Figure 2 below.

Figure 2 - Completed Projects

Attachment F1:

Infiltration Equivalency Analysis & Erosion Control

Infiltration Equivalency Analyses

Infiltration equivalency through a cover system is typically evaluated using two methodologies. These methodologies are the Hydrologic Evaluation of Landfill Performance (HELP) Model and the Giroud Method[1]. Both of these methods have been used to compare the infiltration performance of the ClosureTurf® Final Cover System to the Prescriptive Subtitle D Cover. A summary of the results is shown in Table 1.

The results show that the ClosureTurf Final Cover System provides better infiltration protection than the Prescriptive Subtitle D Standard for construction of landfill final closure systems. These results are expected since ClosureTurf does not allow significant hydraulic head to build up over the geomembrane.

Infiltration Equivalency Analyses	ClosureTurf® Cover System	Prescriptive Subtitle D Cover System
Help Model for Site in Georgia – Average Annual Infiltration (Cubic Feet/Acre/Year)	8.3	347
Giroud Method with Silty-Sandy Soil below the ClosureTurf Peak Daily Infiltration (Gallons/Acre/Day)	1.33	4.51
Giroud Method with Silty-Sandy Soil with Some Clay below the ClosureTurf Peak Daily Infiltration (Gallons/Acre/Day)	0.24	4.51

Table 1 – Summary of Results for Infiltration Equivalency Analyses

Erosion Control

Rainfall Erosion Control Testing

ClosureTurf was tested at TRI Environmental in accordance with ASTM 6459 - Standard Test Method for Determination of Rolled Erosion Control Product (RECP) Performance in Protecting Hillslopes from Rainfall-Induced Erosion. ClosureTurf was tested in a rainfall simulator to an intensity of over 6.5 in/hr with less than 0.04% loss of sand infill.

[1] Rate Of Liquid Migration Through Defects In A Geomembrane Placed On A Semi-Permeable Medium, J.P. Giroud, T.D. King, T.R. Sanglerat, T. Hadj-Hamou and M.V. Khire, Geosynthetics International 1997, Vol. 4, Nos. 3-4.

Figure 3 – Rainfall Erosion Control Testing on ClosureTurf® (3H:1V Slope)

The typical design criterion for sediment runoff on a traditional landfill soil cover is 3 tons/acre/year. The measured loss of sand infill (0.04%) of the ClosureTurf® is approximately 0.03 tons/acre for a 6.5 in/hr rainfall intensity. Using ClosureTurf will significantly reduce sediment loads and runoff turbidity. Also, the ClosureTurf System filters the storm water and provides "clean" runoff as shown in the testing samples in Figure 4 below.

Enhanced Water Quality

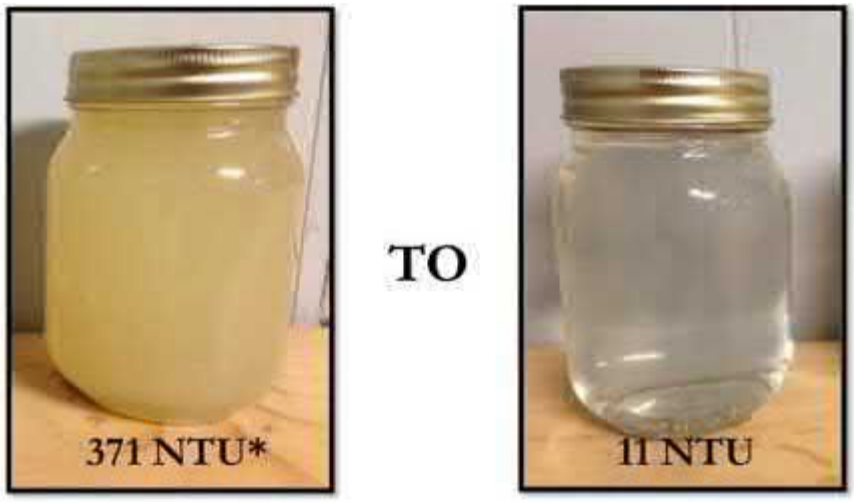

Figure 4* – Storm Water Quality Sampling at two ponds at the same facility
Pond 1 (left sample) drains vegetative CAP
Pond 2 (right sample) drains ClosureTurf® CAP

*2014 ICEG Award winning paper

Parameter	Area with Soil Cover	Area with ClosureTurf®
Turbidity (NTU)	371	11
Total Suspended Solids-TSS (mg/L)	349	<4
pH	6.5	7.3
Total Organic Carbon-TOC (mg/L)	174	1
Toxic Release Inventory-TRI (mg/L)	16	0.5

Table 3 – Analytical Results from Storm Water Samples at a Southeastern Landfill

Large Scale Flume Testing of ClosureTurf® with HydroBinder®

In areas of channelized flow (bench drains, down chutes, and perimeter channels), Watershed Geo suggests that the ClosureTurf® be infilled with HydroBinder® (sand cement infill) instead of just sand. ClosureTurf® with HydroBinder® has been tested at Colorado State University Engineering Research Center (CSU).

CSU tested ClosureTurf® with HydroBinder® in accordance with ASTM D 7277 – Standard Test Method for Performance Testing of Articulated Concrete Block (ACB) Revetment Systems for Hydraulic Stability in Open Channel Flow. The results of the testing were analyzed in accordance with ASTM D 7276 - Standard Guide for Analysis and Interpretation of Test Data for Articulating Concrete Block (ACB) Revetment Systems in Open Channel Flow. Testing was performed to the 5-ft overtop flume capacity which resulted in over 29 fps in velocity and over 8.8 psf in shear stress. The photos in Figure 5 show this steady state testing being performed.

Figure 5 – Steady State Hydraulic Testing of ClosureTurf® with HydroBinder® at CSU

Full-scale Wave Overtopping Testing for Side Slope Protection was also performed on the ClosureTurf® with HydroBinder® at CSU. CSU has the world's largest Wave Overtopping Simulator which they developed for the US Army Corp of Engineers. Testing was performed on HydroTurf for 13 hours with 9 hours at the maximum capacity of the simulator (4.0 cfs/ft which represents a generic hurricane with a 0.2 percent annual exceedance probability – 500-year event). The photos in Figure 6 show wave overtop testing on the HydroTurf.

Figure 6 – Wave Overtopping Hydraulic Testing of ClosureTurf® with HydroBinder® at CSU

January 20, 2021

SUBJECT: CLOSURETURF INFILTRATION EQUIVALENCY TO EPA CCR RULING

Agru America (Agru) understands you are considering use of ClosureTurf as a final cover system for a coal combustion residuals (CCR) enclosure. This letter demonstrates that ClosureTurf exceeds the requirement to "achieve equivalent reduction of infiltration of liquids" as specified in paragraphs (d)(3)(i)(A) and (B) below. The Federal Environmental Protection Agency (EPA) has issued closure regulations under Title 40 of the Code of Federal Regulations, Part 257 (CCR Rules) regarding CCR impoundments that are structured on existing closure requirements for solid waste landfills (40CFR 258.60). The closure cap criteria under Section 257.102(d) specify:

> *(3) Final cover system. If a CCR unit is closed by leaving CCR in place, the owner or operator must install a final cover system that is designed to minimize infiltration and erosion, and at a minimum, meets the requirements of paragraph (d)(3)(i) of this section, or the requirements of the alternative final cover system specified in paragraph (d)(3)(ii) of this section.*
>
> > *(i) The final cover system must be designed and constructed to meet the criteria in paragraphs (d)(3)(i)(A) through (D) of this section. The design of the final cover system must be included in the written closure plan required by paragraph (b) of this section.*
> >
> > > *(A) The permeability of the final cover system must be less than or equal to the permeability of any bottom liner system or natural subsoils present, or a permeability no greater than 1 × 10−5 cm/sec, whichever is less.*
> > >
> > > *(B) The infiltration of liquids through the closed CCR unit must be minimized by the use of an infiltration layer that contains a minimum of 18 inches of earthen material.*
> > >
> > > *(C) The erosion of the final cover system must be minimized by the use of an erosion layer that contains a minimum of six inches of earthen material that is capable of sustaining native plant growth.*
> > >
> > > *(D) The disruption of the integrity of the final cover system must be minimized through a design that accommodates settling and subsidence.*

Similar to landfill closure criteria, the CCR Rules allow for alternative closure cap designs, such as ClosureTurf under Section 257.102(d)(3)(ii):

> > *(ii) The owner or operator may select an alternative final cover system design, provided the alternative final cover system is designed and constructed to meet the criteria in paragraphs (f)(3)(ii)(A) through (D) of this section. The design of the final cover system must be included in the written closure plan required by paragraph (b) of this section.*
> >
> > > *(A) The design of the final cover system must include an infiltration layer that achieves an equivalent reduction in infiltration as the infiltration layer specified in paragraphs (d)(3)(i)(A) and (B) of this section.*
> > >
> > > *(B) The design of the final cover system must include an erosion layer that provides equivalent protection from wind or water erosion as the erosion layer specified in paragraph (d)(3)(i)(C) of this section.*
> > >
> > > *(C) The disruption of the integrity of the final cover system must be minimized through a design that accommodates settling and subsidence.*

Infiltration through a ClosureTurf final cover system (alternative) is compared to that of the CCR prescriptive soil cover system in Table 1.

Table 1

Final Cover Infiltration Equivalency Calculation (Saturated Conditions)				
	CCR Prescriptive Standard		ClosureTurf	
	Subgrade Soil Type: Prescriptive[4]		Subgrade Soil Type: Prescriptive[4]	
Topsoil Thickness (h)	6 in	0.1524 m	0.5 in	0.0127 m
Diameter of GM Hole (d)			1 cm	0.01 m
Area of GM Hole			0.79 cm^2	7.85E-05 m^2
Coefficient for "Good" Contact C_{qo} [1]				0.21
Infiltration Layer Thickness (t_{UM})	18 in	0.4572 m	18 in	0.4572 m
Infiltration Layer Permeability, k_{UM} [2]	1.0E-05 cm/sec	1.0E-07 m/sec	1.00E-05 cm/sec	1.00E-07 m/sec
	Gradient, i ($h/h+t_{UM}$)	0.25	Upper Limit, k_G [3]	3.31E-04 m/sec
Liquid Flow Estimate	Darcy's Law	1.01E-04 m^3/sec/Ac.	Giroud '97	1.06E-08 m^3/sec/Ac.
Estimated Infiltration, Q		**2,308.4 Ga/Ac./day**		**0.2 Ga/Ac./day**

Notes: 1. "Good" contact conditions correspond to a geomembrane installed with a rigorous CQA program, producing as few wrinkles as possible, on top of a low-permeability soil layer that has been adequately compacted and has a smooth surface with final cover level overburden pressure. (Giroud 1997, Giroud & Bonaparte 1989)

2. The prescriptive standard permeability for soil liners, or infiltration layers, is 1 x 10-5 cm/sec in typical state final cover regulations in compliance with SubTitle D of the Federal regulations.

3. The Upper Permeability Limit represents the limit of calculation validity. Infiltration layer soil permeability above these levels begin to transition into Bernoulli flow conditions. (Giroud 1997)

4. Mixtures of clay, sand and silt.

This comparison uses Darcy's Law (Q = kiA) for liquid flow through soil to estimate fluid flow through one acre of prescriptive final cover. The infiltration estimate for ClosureTurf is based on the following equation[1]:

$$Q = 0.976 C_{qo} \left[1 + 0.1 \left(\frac{h}{t_{UM}} \right)^{0.95} \right] d^{0.2} h^{0.9} k_{UM}^{0.74}$$

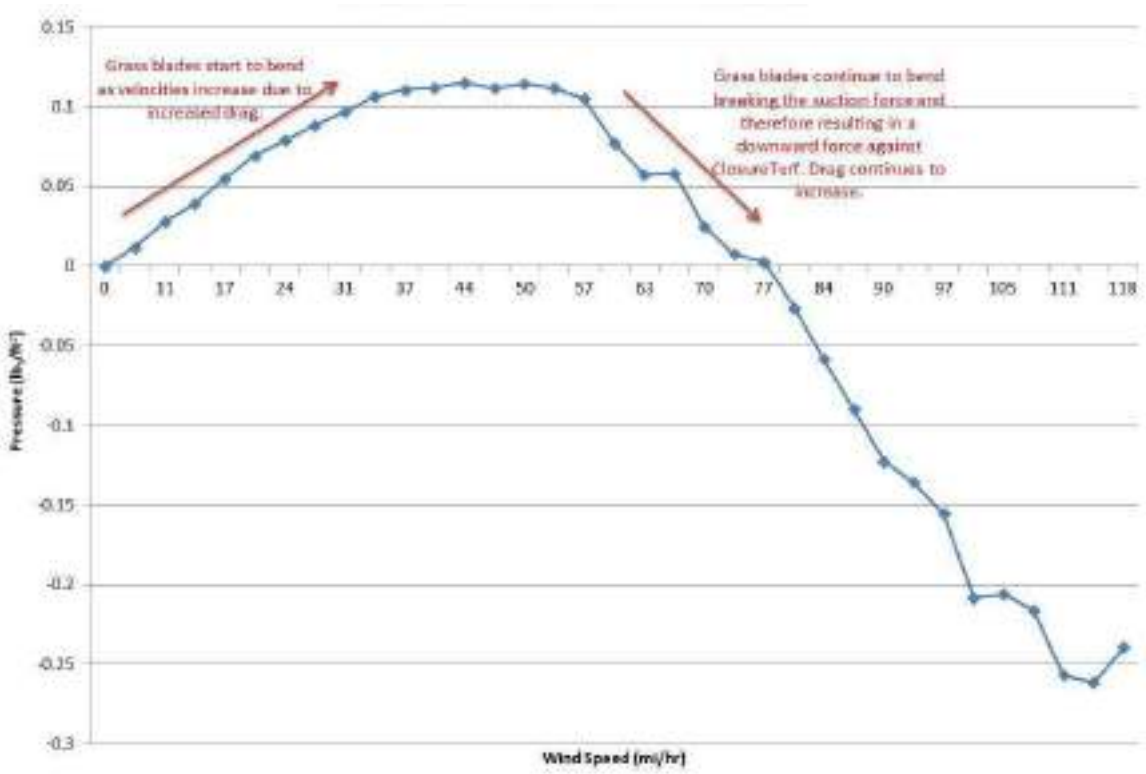
As shown in Table 1, the infiltration potential of ClosureTurf is much less than the prescriptive standard. This is due to the very small hydraulic head, h, associated with the ClosureTurf final cover system. Also, given modern Construction Quality Assurance (CQA) techniques, the likelihood of Giroud's assumed 1-cm diameter hole per acre in the Supergripnet geomembrane component of ClosureTurf is very conservative.

Wind and Water Erosion

ClosureTurf has been tested for wind and rainfall erosion resistance. It was subjected to hurricane category 3 windspeed at the Georgia Tech Research Institute wind tunnel to determine the turf's resistance to wind uplift forces commonly associated with "exposed" geomembrane. The wind tunnel testing reveals wind shear force is the predominant force requiring design consideration. Figure 1 are the results of the wind tunnel testing and demonstrate exception performance against wind forces.

[1] Giroud, J.P.,King, T.D., Sanglerat, T.R., Hadj-Hamou, T. and Khire,M.V., 1997, "Rate of Liquid Migration Through Defects in a Geomembrane Placed on a Semi-Permeable Medium", Geosynthetics International, Vol. 4, Nos. 3-4, pp. 349-372.

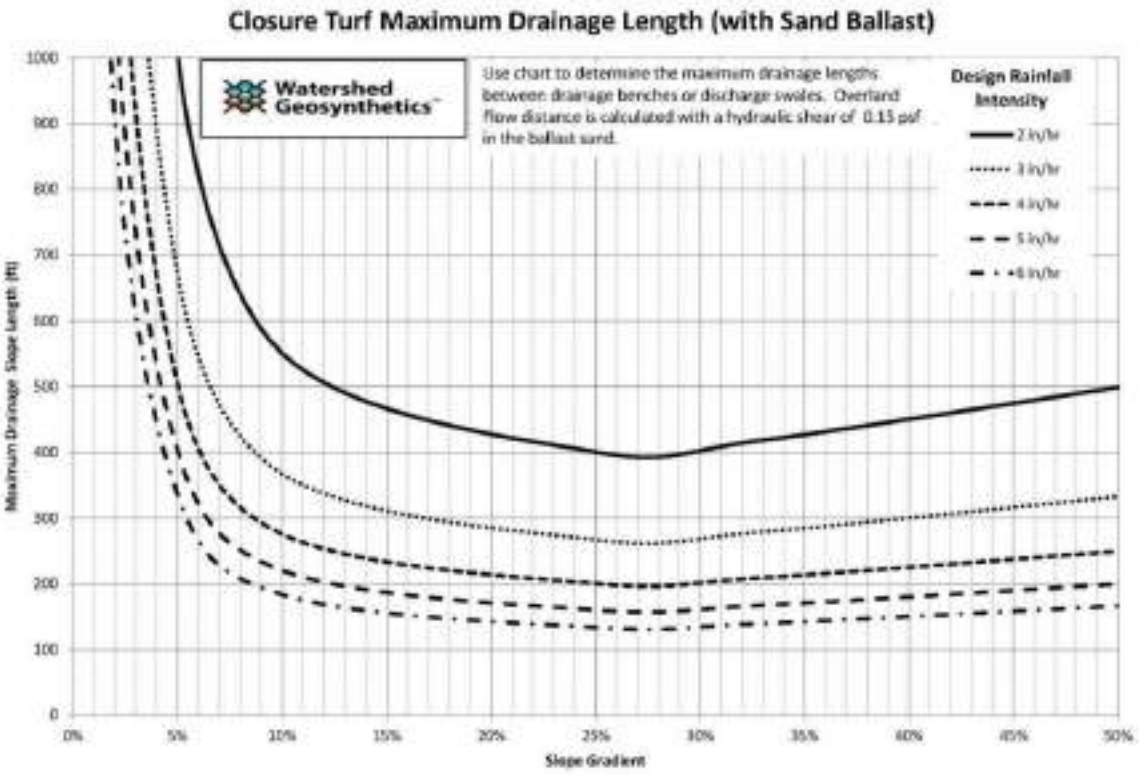
Figure 1



For water erosion protection, ClosureTurf was tested for slope erosion resistance using test method ASTM D6459 conducted by Texas Research International (TRI). In addition, the sand ballast was tested by TRI for concentrated flow using test method ASTM D6460 to determine the maximum allowable hydraulic shear force to avoid sand movement within or removal from the turf blade matrix. These studies resulted in the information presented in Figure 2.

Using the information in Figure 2, design engineers can specify spacing of slope benches to capture slope run-off and convey run-off to discharge points in a safe manner. In the case of CCR impoundments, topdeck slopes are generally less than 5-percent. Inspection of Figure 2 reveals the ClosureTurf system can accommodate large reaches of surface run-off before conveyance structures are required in the hydraulic design.

Figure 2



Final Cover Settlement/Subsidence

The prescriptive final cover design for CCR impoundments is a soil liner as described in Section 257.102(d)(3)(i). However, CCR impoundments typically have very poor bearing strength. Construction of a CCR soil liner will involve use of heavy soil moving equipment. This will result in significant amounts of differential settlement. The Geosynthetic Research Institute investigated the performance of soil liners undergoing differential settlement and found the average allowable elongation of soil liners before cracking develops is 0.31%. Typical settlement induced strain ranged from 2 to 27 percent.

In stark contrast, the break elongation of Agru's LLDPE Supergripnet and Microspike geomembranes are 300 and 400%, respectively. LLDPE resin based geomembrane is typically used for final cover applications due to this compatibility with settlement induced strain.

Conclusion

When compared to the typical performance of a soil liner final cover system, the ClosureTurf final cover system provides equivalent to superior performance when compared to the prescriptive cover minimum standards described in paragraph (d)(3)ii(A) of 40CFR 257.102.

If you have any questions regarding this matter, please call the undersigned at (916) 218-8375.

Very Truly Yours,

AGRU-America, Inc.

Longevity, Protection,

and other

considerations

Longevity and Protection Provided by ClosureTurf®

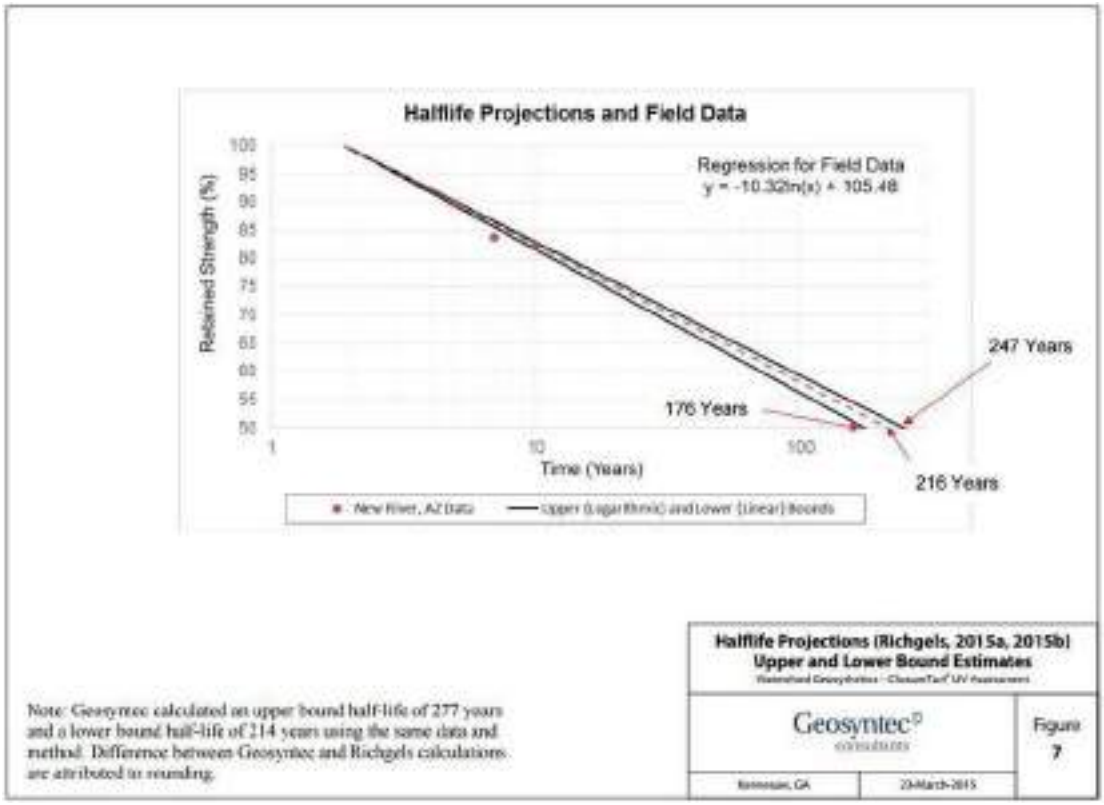
ClosureTurf® is not an exposed cover system, it is a hybrid system that provides full protection of the most critical element of the closure system. ClosureTurf differs from exposed geomembrane systems as follows:

Access and drivability of exposed geomembrane systems are severely limited without means of protecting the geomembrane. In addition, exposed geomembranes are vulnerable to wildlife trafficking. The engineered Turf component serves as a protective ballast providing physical protection and weathering protection.

Since ClosureTurf looks and feels like natural vegetation, it is significantly more aesthetically pleasing than an exposed geomembrane system with hydraulic parameters that do not create fast time of concentrations and energy dissipation issues to the degree of that of exposed membranes.

ClosureTurf has a longer functional longevity than exposed geomembrane systems. For ClosureTurf, the synthetic turf layer provides protection of the structured geomembrane such that it is not exposed to the elements. If properly maintained, the Engineered Turf layer will have a 100+ year functional longevity. The results for 10 years of independent weathering data for the artificial turf yarns are shown in Figure 7. When this data is extrapolated out to 100 years, the yarn has an approximate 65% retained tensile strength. In other words, the design half-life of the engineered turf layer far exceeds 176 years. This longevity has been independently evaluated by multiple organizations who are experienced in the longevity performance of geosynthetics.

Figure 7 - Independent longevity analysis project



Static and Dynamic Load Evaluations

Traffic Loading Evaluation

Rubber tired vehicles, and some steel-track equipment, are allowed to drive on the ClosureTurf® system. Typically, on slopes, we suggest vehicles with ground pressures less than 60 psi, and on flat decks (2% or less) and designed access roads, we suggest vehicles with tire pressures less than 100 psi. Detailed calculations for puncture of the geomembrane from wheel loading have been performed as well as lateral movement on account of vehicle braking have been performed on numerous applications for final cover.

Aerodynamic Evaluation

ClosureTurf has features that help mitigate the forces of wind. These include a porous surface to break the vacuum, and turf blades that will increase the aerodynamic boundary conditions and react against the wind causing a resistance to the uplift component.

The ClosureTurf System was evaluated in the wind tunnel at the Georgia Tech Research Institute (GTRI). It was tested up to 120 mph without uplift. Based on these results, the ClosureTurf System is projected to withstand 150+ mph winds when properly designed. The photo in Figure 8 shows the test at 170 fps (120 mph).

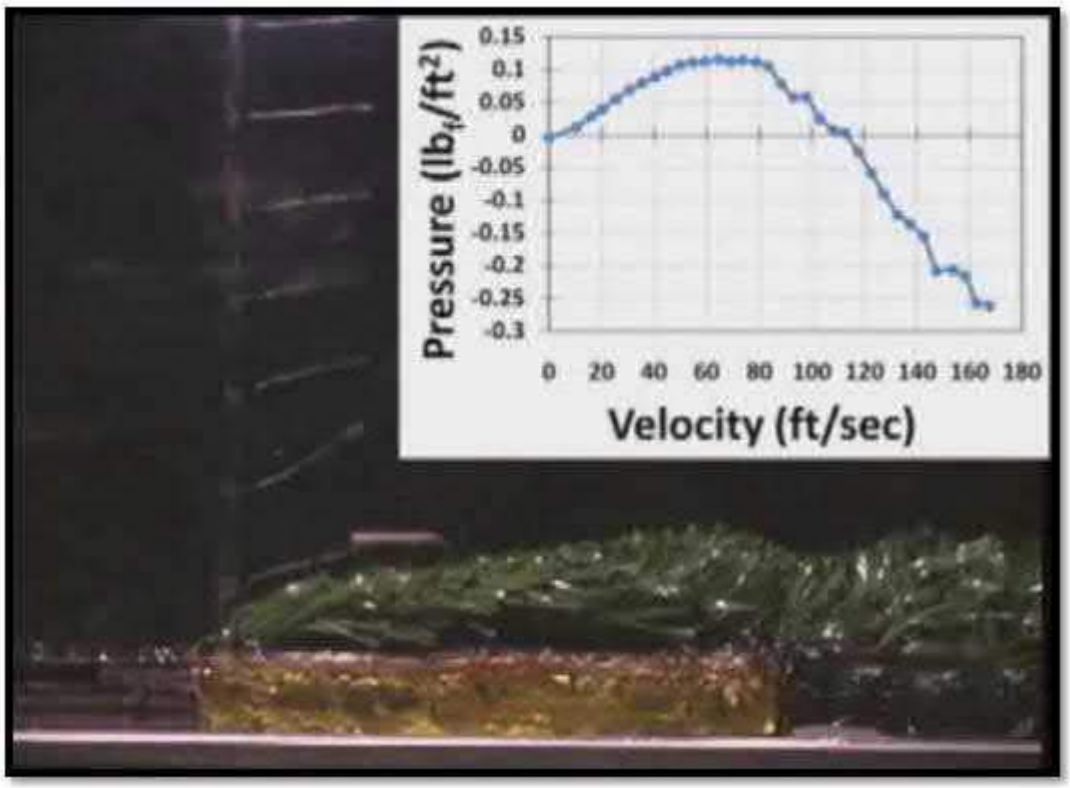


Figure 8 – Aerodynamic Evaluation of ClosureTurf® at GTRI

Carbon Footprint

ClosureTurf® has approximately 1/5 the carbon footprint of the Subtitle D traditional prescription cover system. The factors influencing the carbon footprint, and other environmental impacts, are related to reduction of 350 haul trucks per acre that is normally required to haul the adequate amount of cover to meet the specifications of the regulatory prescriptive cover. Other impacts include the destruction of land for borrow soil, sediment from land disturbance. The details of the carbon footprint calculations are shown in the following chart in Figure 9.

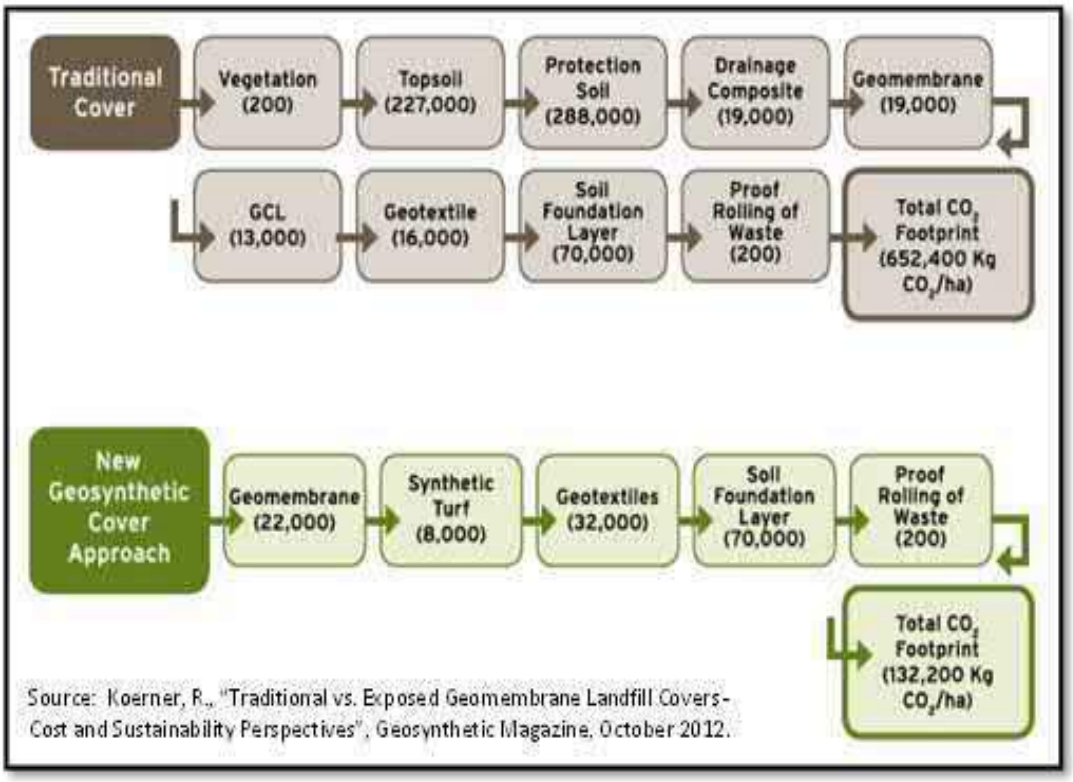

Figure 9 – Carbon Footprint Evaluation of ClosureTurf vs. Traditional Cover

Emission Control

The ClosureTurf system prevents fugitive emissions by totally encapsulating the closed areas. When integrated with conventional gas collection systems, higher collection efficiency along with reduced oxidation potential of the waste mass can be expected. If the patented ClosureTurf Surficial Gas Collection system is utilized, high collection efficiency, no oxidation potential along with significant reduction in condensate generation can be realized. Slope stability issues associated with landfill gas buildup beneath the soil/membrane (prescriptive) caps are diminished with the ClosureTurf system as a result of no soil loading, there is nothing to fail. The ClosureTurf system also has patented designed automatic relief valves to compensate for gas buildup pressure during periods of malfunction of the primary gas collection systems.

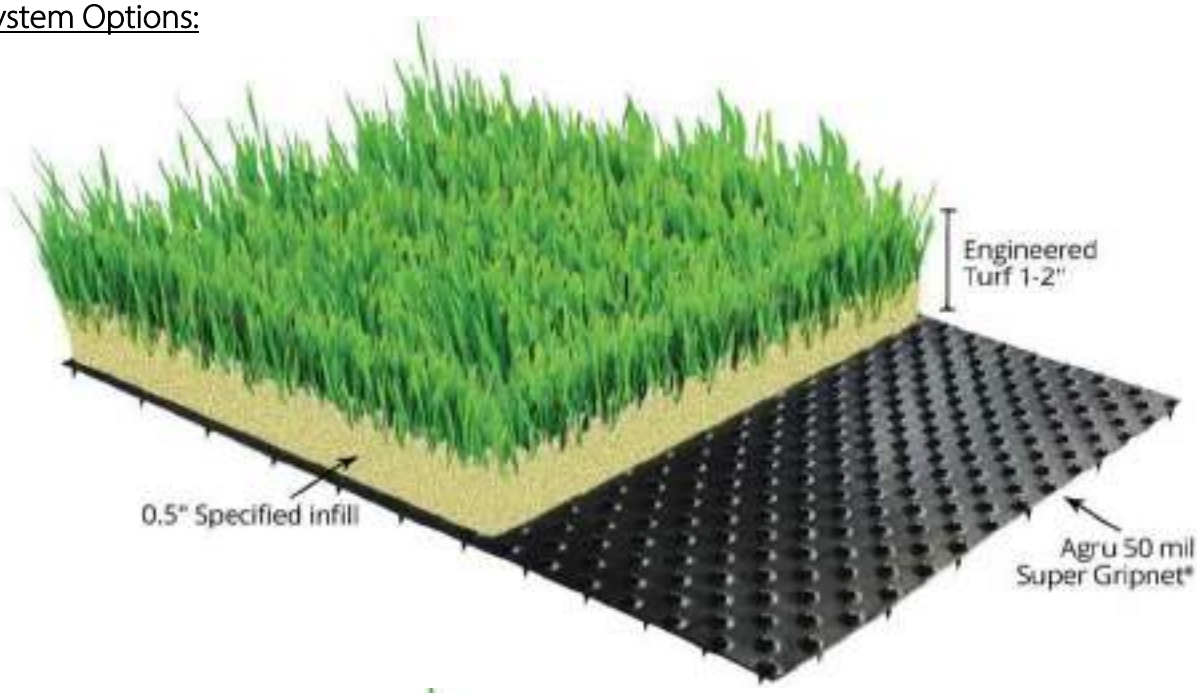
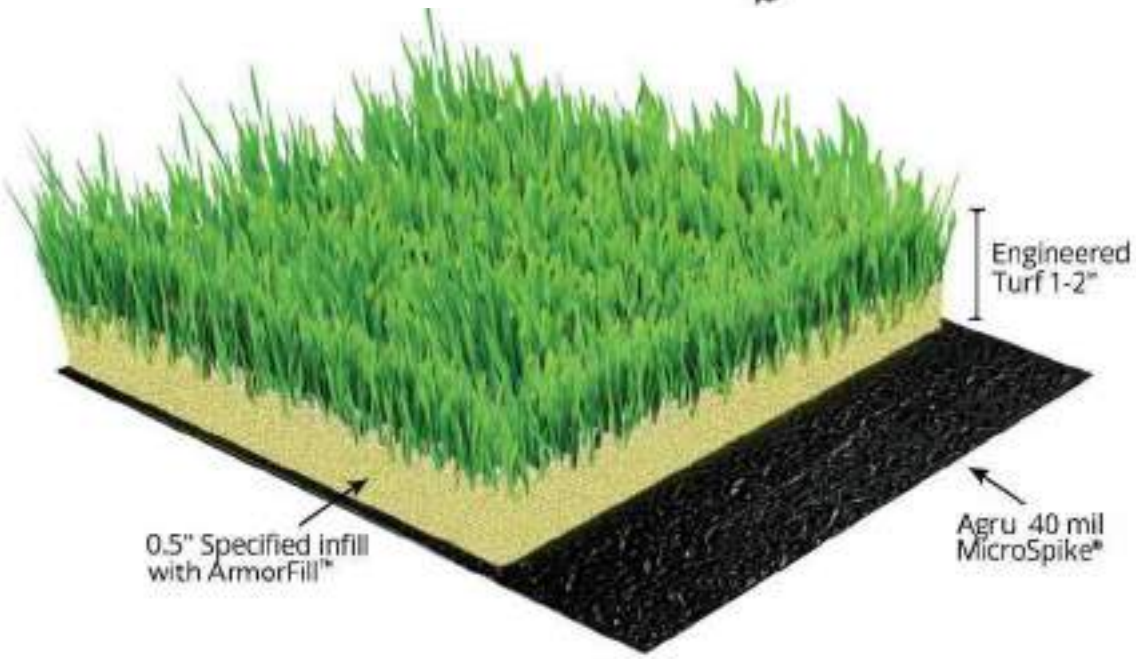
CLOSURETURF® SYSTEM & DESIGN

System Options:





$2.50/Square Foot ± 10%*

* Site-specific analysis and recommendation will include a more targeted budget estimate

Components:

1. Structured HDPE or LLDPE Geomembrane

AGRU MicroSpike® (40 mil)
Used on slopes < 3.5H:1V

Top

Bottom

AGRU Super GripNet® (50 or 60 mil)
Used for **drainage** on slopes >3.5H:1V for increased interface friction

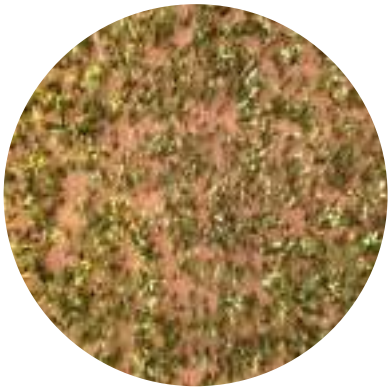
2. Engineered Turf

Olive

Blend

Tan

3. Specified Infill



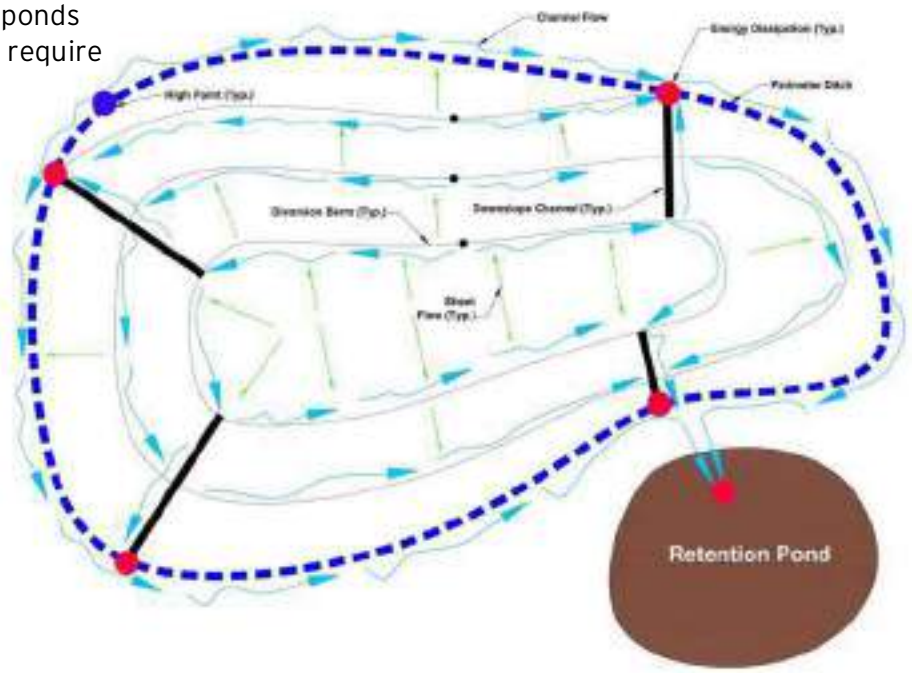
ASTM C-33 Sand
For typical flat areas and sheet flow on slopes

ArmorFill™
For higher velocities; use with benchless cover and MicroSpike membrane

HydroBinder®
For areas where designer would normally spec riprap, pipe or articulated concrete block

Typical Hydrology Design

- Mitigate the volume & sheer forces with diversion berms
  - Channelize the storm water
  - Helps convey off of cover system
- Benches go to downchutes
- Downchutes go to retention ponds
  - ClosureTurf does not require sediment settlement



HydroBinder™ Features & Benefits

HydroBinder is a specialized pozzolanic infill created specifically for bench drains, downchutes and perimeter channels on landfill covers. It will flex and move with typical differential settlements that occur on permanent covers. It provides superior hydraulic performance capable of handling high sheer stress and large flows resulting in very high velocities.

CLOSURETURF® INSTALLATION

1. Subgrade Preparation

2. Surficial Gas Management System (if applicable)

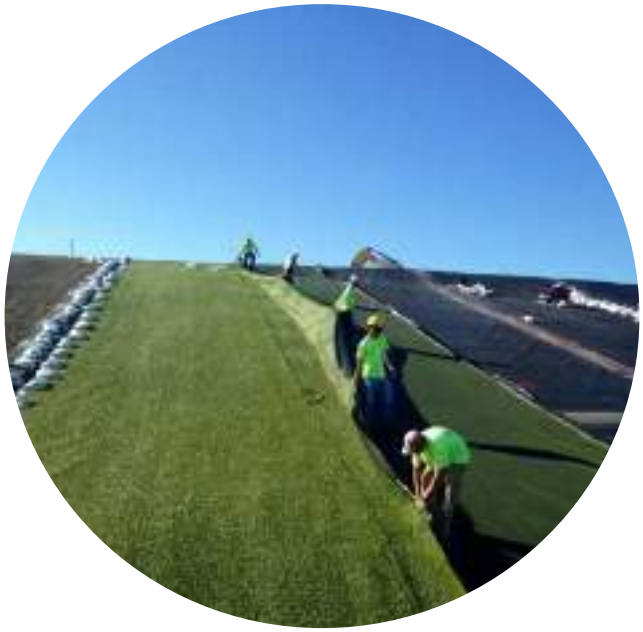
3. Geomembrane Liner

Geomembrane arrives on site in rolls.

Workers manually unroll the membrane down the slope.

Geomembrane seams are heat welded together.

4. Engineered Turf



Workers manually unroll the engineered turf down the slope and position for seaming.

Turf seams are heat welded together.

5. **Sand Infill**

Sand slinger evenly distributes sand on the engineered turf.

Sand is brushed into the turf.

Sand is sprayed with ArmorFill™ (if applicable).

Sand bound with ArmorFill.

6. Malfunction Relief Valves

Before valve is installed.

After valve is installed.

ClosureTurf integrates easily with traditional gas systems.

CLOSURETURF® WATER QUALITY

When considering a final cover system for a landfill, it is not only important to keep the water out, you must also ensure that nothing detrimental comes off the surface and lands in the water carried off your site.

Closed landfills can generate large amounts of surface runoff. With a traditional soil cap, rainstorms will ultimately carry off sediment and dissolved materials such as fertilizers and chemical components. They also require a water collection area to allow the sediment to settle out before it can be released off site. This requires more space, more monitoring and ultimately more dollars.

Because soil loss from runoff is virtually eliminated with ClosureTurf®, water quality is no longer an issue. The sand infill component acts as a natural filter as the water moves down the slope and surface water runoff pond maintenance can be reduced proportional to the area covered. When retention ponds no longer require sediment storage and sediment baffles, overall volume of the pond is significantly increased. Surface water runoff areas that are lined with a cementitious infill will no longer need water quality orifices, sediment removal berms and sediment routing baffles installed in the sediment ponds. In fact, the name "sediment pond" may be changed to "surface water pond" because there is no longer a significant sediment element contributing to the total volume required. Also, the ponds can be considered DE-tention ponds rather than RE-tention ponds because water is only held long enough to mitigate the design-storm event. Another unique feature of ClosureTurf is the ability to rely on sheet flow versus accumulated concentrated flows (such as exists with on-slope berms and down chutes). This results in dramatically increasing time of concentration, and therefore the amount of sediment pond storage volume when compared to a vegetative cover.

One of the most important issues concerning proper site erosion control is the turbidity of the surface water as it is discharged from the site. A third party analysis was performed that compared turbidity on a closed cell of ClosureTurf versus a cell with a soil cover cap at the same landfill. The study was done at a site having a history of NTU exceedance due to the very fine sediment soils that are common to the region. Data samples collected showed ClosureTurf at 11 NTU's and the soil cap at 371 NTU's (shown in image on right). After years of attempting a wide variety of erosion control methods, the landfill owner was finally able to get well below the minimum Turbidity values required by the regulations.

The hydrology and erosion elimination characteristics of ClosureTurf provide many environmental benefits that contribute to water quality. It results in very low storm water runoff turbidity and provides water quality improvement across the spectrum. But perhaps, most importantly, it can provide repeatable water quality results for every design storm event so that no matter where or when the water flows off site, you can be rest assured it's clean.

> BACK TO MENU

Borrow Soil

Borrow pits necessitate the destruction of land. Often times this land is native, undisturbed and it is only being destroyed to provide soil for a landfill cover. Eliminating the need for a borrow pit makes environmental as well as economical sense. Depending upon the proximity of borrow sources, soil can be a costly item to get on site. Not only does ClosureTurf eliminate this layer, it also reduces the need for construction vehicles to transport.

Incremental Closures

ClosureTurf makes it easy to install in smaller, incremental closures. The sooner full cells can be capped, the sooner gas is controlled and captured and leachate is reduced, providing significant savings for the owner.

Accelerated Project Schedule

The consistency offered by a standardized system such as ClosureTurf® provides efficiencies that can be easily realized, from pre-design through construction. From standardized construction details, to a reduction in site elevation surveys, including the elimination of the typical 24" (600 mm) soil layer across the entire surface of the closure cap. A significantly larger amount of closure acreage can be constructed versus a traditional soil cover, effectively allowing more projects to be constructed with a given set of fixed resources. Typically, ClosureTurf installs at least 50% faster than traditional covers.

Post Closure Care

The annual maintenance costs for ClosureTurf runs, on average, more than 90% lower than those for a traditional soil and vegetated cover system. The following is an example of a maintenance activity comparison.

Traditional Cap	ClosureTurf
Mowing (4 events per year)	Not Required
Erosion Control (2 events per year)	Not Required
Reseeding (1/3 area once per year)	Not Required
Fertilizing (1/3 area once per year)	Not Required
Soil Replacement (typical 1 ton/per acre per year avg – per EPA)	Sand infill replacement (<2% total area per 5 years)
Pond Cleanout (avg once per every 4 years)	Not Required
Major Storm Repair (4 hours equipment after 1 event/year)	Not Required
Site Inspection (1 inspection per quarter)	Site inspection (Every 5 to 10 years)
Financial assurance (-2% per year)	Financial assurance (-2% per year)

4 acres & 12 acres

Covanta puts an end to constant slope repair with a stable and cost-effective closure technology.

With more than 60 acres of closed landfill space to manage, Steve Melloni, Covanta Energy's Regional Landfill Manager, has a lot on his plate. Most of his closed waste to energy ash landfills are traditional Subtitle D vegetation caps. His site supervisors oversee the monthly maintenance of mowing and the occasional reseeding.

"Most of our maintenance is typical with grass," said Melloni. "However, when inclement weather strikes much like it has in the last two years, we are on standby to manage any repercussions. That could include costly repairs such as rebuilding slopes, replacing soil and re-establishing vegetation. "

770.777.0386 • www.closureturf.com

WG WatershedGeo® Unearthing Solutions

In 2014, Melloni and his team began evaluating an alternative closure system called ClosureTurf® for the their 12-acre Carver-Marion-Wareham Landfill in Carver, MA. This particular site overlooks Buzzards Bay making it heavily exposed to weather elements such as wind, rain and snow. With these extreme conditions, they anticipated the slopes would weaken, become unstable, and require constant rebuilding. The ClosureTurf system offered a solution that eliminated that risk, Melloni said. "Once we did our research and evaluated other sites, we focused on the long-term aspects of the system and found that ClosureTurf required very little maintenance, if any, after installation. That was a slam dunk for us."

ClosureTurf meets and exceeds the requirements set forth by the EPA in Subtitle D. It is a three component system that eliminates the need for soil all together.

"While ClosureTurf has many advantages, we really liked that it provided around 12,000 cy of extra capacity for ash," explained Melloni. "Because the two feet of soil is not required, we were able to use that space to our advantage."

With the internal decision solidified, the next step proved to be the most challenging. Covanta submitted their application to the regional Massachusetts Department of Environmental Protection (DEP) office. Because this would be the first use of ClosureTurf in the state, the agency wanted some time to do its homework and fully evaluate each component of the system. With time constraints to complete the project looming, the DEP agreed to allow ClosureTurf to be used on the 4-acre top deck but required the use of a traditional vegetation system on the side slopes.

According to Melloni, site conditions proved to be somewhat challenging for installation. "With 30 mph winds, the main concern was getting the Agru Super GripNet® geomembrane to lay down nice and tight in order to avoid wrinkles and maximize performance. The crew did an amazing job and lots of care was given to ensure the membrane went in correctly."

"Another thing we experienced on site was when we began installing the engineered synthetic turf, gas began to build-up and we started to see pockets form," he said. "We eliminated this by installing a specialized ClosureTurf gas vent on every acre. Once the relief values were in place, the turf laid down perfectly. We were able to incorporate this seamlessly with our traditional gas collection system."

Underneath the ClosureTurf system, gas is generated and rises to the surface where a vacuum created by the differential pressures is vented through the surficial gas collection foot. This proved to be an efficient method of gas collection while reducing the amount of condensate that needed to be managed.

As far as satisfaction levels to date, Melloni said, "The site has performed exceptionally well. The last two summers have been some of our hottest and we have experienced some torrential down pours.

The ClosureTurf system has held up wonderfully with no maintenance to date."

In fact, the Covanta team was so impressed with the CMW project, they decided to use ClosureTurf on a separate site in Haverhill, MA. "This project was actually approved by a different agency that governs our Northeast region so we had different people evaluating ClosureTurf," explained Melloni. "Once the product was presented and vetted, it was approved to use on all twelve acres of our Haverhill site. Again, we were able to increase ash capacity and consider the cost savings with maintenance."

The Haverhill site design was a little different than the previous site, explained Melloni. "We had big diversion berms along the side slopes on this site. In fact, these are the first things you see when you drive up to the site. We chose the olive green ClosureTurf product and my first inclination was that you would see this fake green colored turf right off the bat. However, the grass and sand infill have blended together so well that you get a very natural-looking, grass-like appearance. I am very pleased with just how real this site looks."

The back sides of the diversion berms were another area where ClosureTurf defied design. "The back of the berm transitions from 2:1 slopes to 3:1," said Melloni. "I was concerned that the sand infill would trap and build, and ultimately look out of place. Surprisingly, even with all of the rain, we've had no wash overs and the sand has stayed in place very well."

As with any landfill site, managing water flow effectively can prove to be challenging and very important to the functionality of the design. Created specifically for down chutes, bench drains and perimeter channels, HydroBinder® cementitious infill provides superior hydraulic performance capable of handling large flows on steep gradients. "Our action swales on this site turned out to be some of the best we've ever done," said Melloni. "With the water velocity and pressure we get, I was concerned the turf would balloon up and not sit tight on the ground, however the HydroBinder weighted it down perfectly. There is no bubbling effect and the water flows down smoothly and cleanly."

Because ClosureTurf requires no soil or fertilizing, stormwater runoff is clean of debris. The sand infill provides a natural filter for water running off of the slopes which dramatically improves water quality, making it an effective BMP for Clean Water Act requirements.

Covanta plans to continue using ClosureTurf in additional site designs. Melloni and his team are extremely happy with the product.

"I love to show our ClosureTurf sites off," said Meloni. "Its hard to imagine a product like this working so well until you see it in action. Our sites have performed beautifully and I constantly remind everyone of the cost benefit this has brought to the table."

Crews work to pull the Super GripNet® geomembrane tight during windy conditions.

Attachment F4:

Technical Note on Design Life

Technical Note

Design Life of ClosureTurf®

The ClosureTurf® Final Cover System is projected to last well over one hundred (100) years, provided it is installed and maintained in accordance with Watershed Geosynthetics' standard specifications. This duration exceeds the current post-closure regulatory period of 30 years by more than 3 times. During that time, the average maintenance cost of the ClosureTurf system will be roughly 10 to 20% of the cost for maintenance of a traditional soil cover system.

ClosureTurf Components

To better understand system longevity, it is helpful to break down the system into its components and explain the function of each component. A cross-section of the ClosureTurf system is shown in Figure 1 to aid the discussion.

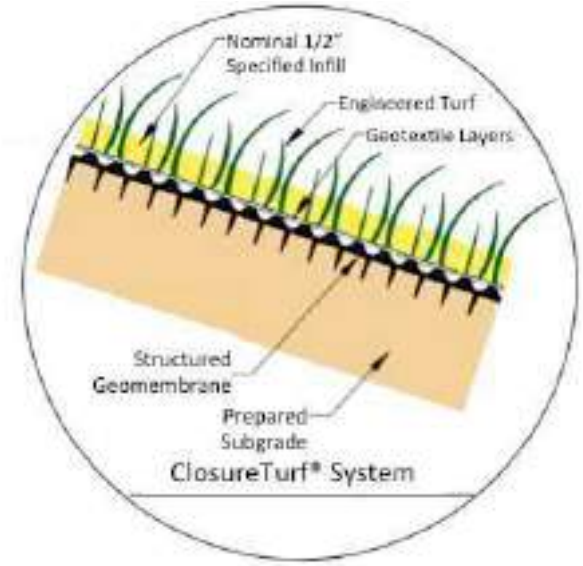

Figure 1. ClosureTurf® Cross-Section

Starting at the prepared subgrade and moving vertically through the cross-section of the system, the first component is the structured geomembrane. The structural geomembrane layer creates an impermeable hydraulic barrier providing the actual environmental containment. Moving upward through the cross-section, the second component is the engineered turf layer. The engineered turf layer is comprised of two distinct parts: (1) a double-layer woven geotextile backing with enhanced ultraviolet (UV) resistance; and (2) polyethylene turf fibers (or yarns) tufted into the woven geotextiles. The third, and final, component of the ClosureTurf system is the specified infill. The specified infill is an angular, specifically graded sand resting on the geotextile backing and within the individual turf fibers of the engineered turf layer.

UV Protection

The geomembrane is covered by the engineered turf and sand protecting the geomembrane from UV exposure. Based upon research by Geosynthetic Institute (GSI) [Koerner et al., 2011 and Koerner et al., 2012], a covered geomembrane has an expected lifetime (i.e., a half-life) of several hundred years. The sand infill and turf fibers provide UV shielding of the geotextile backing of the engineered synthetic turf. With the sand infill in place, the geotextile backing will remain intact and in place covering the structured geomembrane, allowing the geomembrane to realize its full design life. The sole component of the ClosureTurf system exposed to UV is the turf fibers.

Longevity of Turf Fibers

Longevity of the turf fibers dictates the design life of the ClosureTurf system. UV longevity testing on the turf fibers indicates the half-life is projected to be over two hundred years, as presented in Attachment 1, *Literature Review and Assessment of ClosureTurf® UV Longevity* prepared by Geosyntec Consultants. At year 100, the turf fibers are projected to have approximately 60% of the original tensile strength. The average tensile strength of virgin turf fibers is approximately 35 lbs per fiber. Therefore, the tensile strength at year 100 is projected to be approximately 20 lbs per fiber, which is significantly greater than the estimated minimum tensile strength necessary for the turf fibers to perform in application (i.e., approximately 2.5 to 3.5 lbs per fiber). Turf fiber tensile strength values over time compared to the required service value are presented in Figure 2.

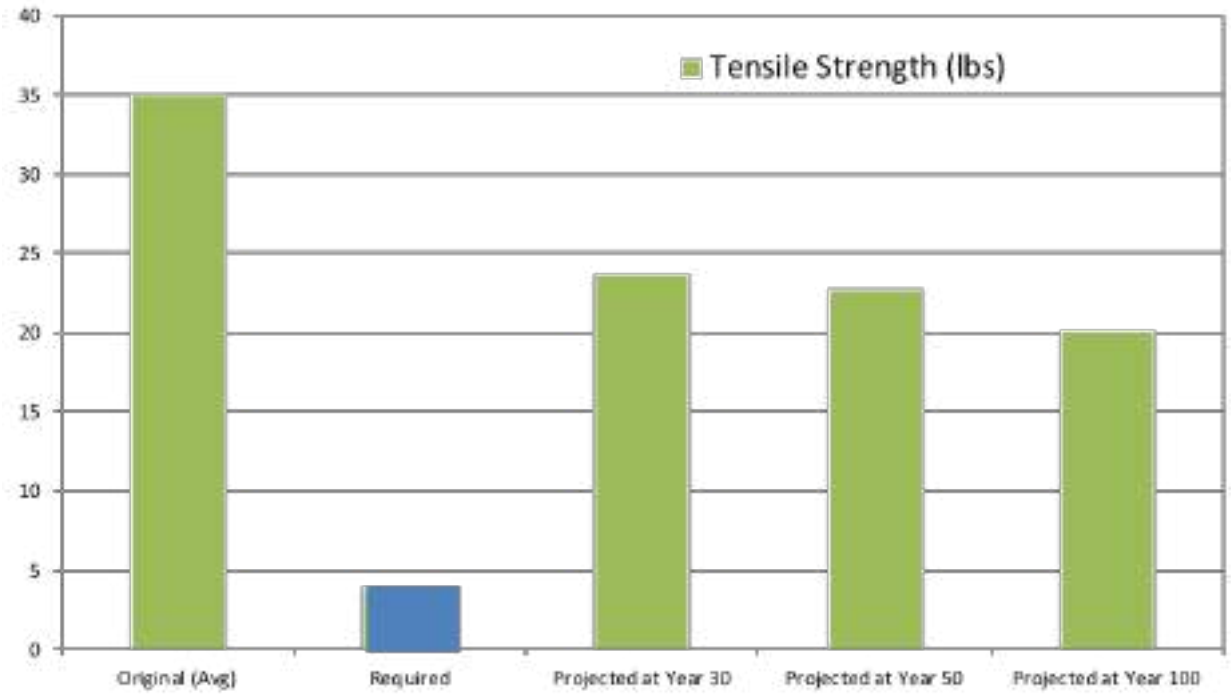

Figure 2. ClosureTurf® Fiber Tensile Strength

Field samples of turf fibers have been collected and tested for tensile strength at an independent laboratory. Samples were collected at two ClosureTurf installations, the LaSalle-Grant Landfill in Louisiana and the Saufley Field Road Landfill in Florida. The field sample turf exposure times ranged from five to eight years. The retained tensile strength of the turf field samples was compared with the laboratory UV testing results in New River, Arizona, as presented in Figure 3. Field performance of the engineered turf tensile strength matches or exceeds results from laboratory testing of UV exposure.

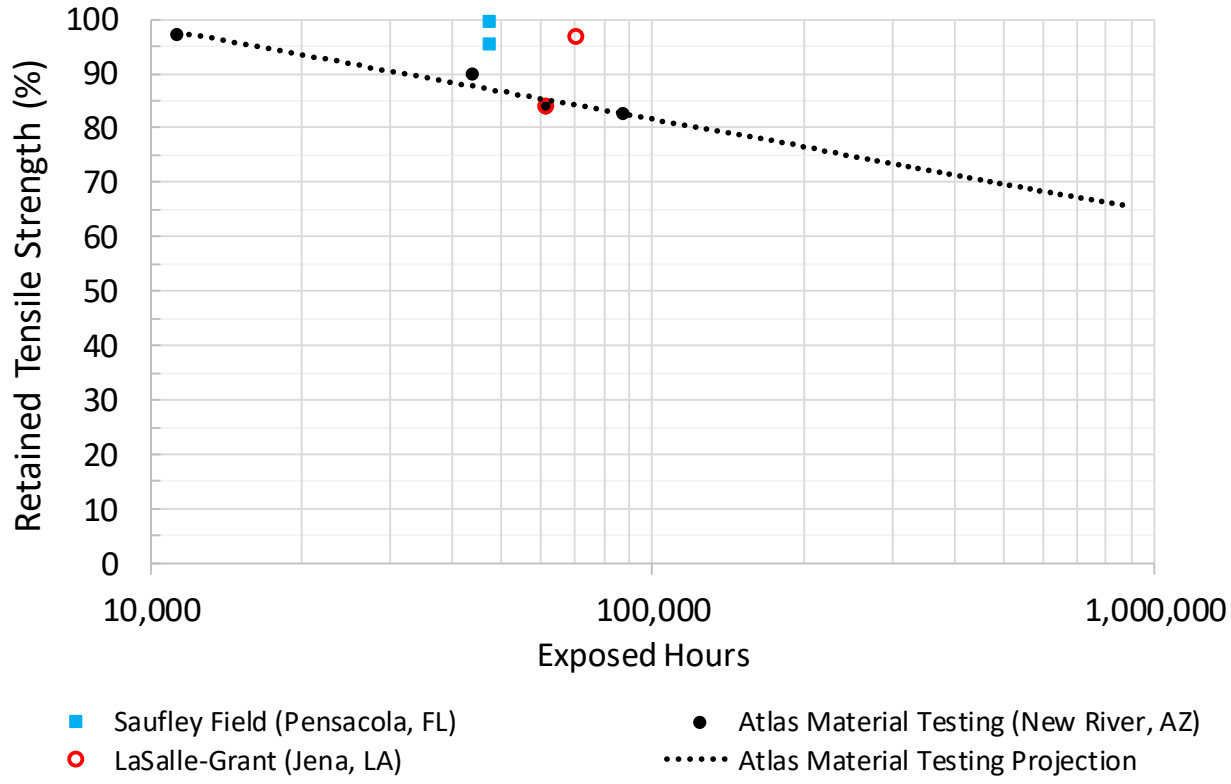

Figure 3. ClosureTurf® Fiber Tensile Strength, Field Performance

Maintenance Cost

As with any closure system, regular maintenance activities are required with the ClosureTurf system. Standard maintenance activities include, primarily, periodic visual inspection (e.g., once per quarter or once per year) and localized sand placement to cover exposed geotextile backing, as needed, at five-year intervals. The average maintenance cost for the system will typically be 10 to 20% of the cost for maintenance of a traditional soil cover system. Watershed Geosynthetic's experience with existing ClosureTurf installations suggests an average budgetary amount for maintenance is $150 to $250 per acre per year. As a comparison, a typical soil cover system has an estimated average maintenance cost of $1,200 to $1,500 per acre per year.

Subject: Literature Review and Assessment of ClosureTurf® UV Longevity

Dear Mr. Urrutia:

Watershed Geosynthetics, Inc. (Watershed) has patented an alternative landfill closure system termed, ClosureTurf®. ClosureTurf® consists of high-density polyethylene (HDPE) grass blades tufted through a polypropylene (PP) geotextile backing which overlies Super Gripnet®, an HDPE or linear low-density polyethylene (LLDPE) geomembrane manufactured by AGRU America Inc. The addition of a layer of sand ballast during installation completes the system. The sand ballast provides cover for the lower portion of the HDPE grass blades, the PP geotextile backing, and the Super Gripnet® (Figure 1). The ClosureTurf® system, therefore, is a "hybrid" closure system in the sense that it is neither a traditional soil cover or an exposed geomembrane. ClosureTurf® has been used to close a number of landfills throughout the United States. A select list of sites where it has been used is shown in Table 1. Applications extend to other facilities as well, such as capping of coal ash ponds.

Watershed has requested that Geosyntec Consultants, Inc. (Geosyntec) provide an assessment of the longevity of the ClosureTurf® system with regard to UV degradation. Since ClosureTurf® has elements (i.e., the HDPE grass blades) that are permanently exposed to UV radiation, this assessment will be particularly focused on the exposed portion of the system. However, the UV longevity of the PP geotextile backing and HDPE geomembrane will also be addressed by reference.

Geosyntec's approach to this assessment has been to conduct a literature review of pertinent documents available (journal papers, white papers, presentations, etc.), distill the results of the review, and perform limited analysis. This report concludes with a summary of the review and analysis along with brief discussion for recommendations.

EXECUTIVE SUMMARY

The UV longevity assessment of the ClosureTurf® system (Figure 1) began with a literature review. In general, relatively little published information was discovered regarding exposed HDPE grass blade degradation. The information that is available consists of retained tensile strength test results of HDPE grass blades after exposure (1, 5, 7 and 10 years) at a field test facility in New River, Arizona (Watershed, 2014). Extrapolation of this data by Watershed (2014) resulted in a prediction of 65% retained tensile strength after 100 years of service. In addition, Richgels *et al* (2015) published half-life (i.e., 50% retained tensile strength) predictions of exposed HDPE grass blades using a laboratory data release from the Geosynthetics Institute (GSI) on HDPE geomembrane strips exposed to UV lamp irradiation. Richgels *et al* (2015) obtains an upper bound and lower bound half-life predictions of 247 years and 176 years, respectively. Extrapolation of the field data from New River, Arizona yielded a half-life of 216 years.

Geosyntec checked the calculations shown in Richgels *et al* (2015) and obtained 277 years and 214 years for the upper and lower bound estimates of HDPE grass blade half-life. Differences in the results between Geosyntec and Richgels *et al* (2015) are attributed to rounding. Geosyntec attempted to repeat these calculations for actual performance requirements (i.e., 12.5% of original tensile strength) of the HDPE grass blades rather than a randomly assigned half-life, however the predictions resulted in service lives that were too lengthy to be reasonable. The most likely explanation is that the laboratory data has not degraded enough to allow for service life predictions using 12.5% retained tensile strength. Future data releases from GSI will aid in providing more accurate predictions below the half-life.

Based on Richgels *et al* (2015) predictions, as well as the prediction given in Watershed (2014) it appears that the half-life of the HDPE grass blades exposed to Arizona-like conditions is on the order of 100 years. These results are promising; however additional field test data is needed to improve the half-life predictions, particularly since half-life predictions for exposed HDPE geomembrane are also approximately 100 years (Koerner *et al*, 2015). Understanding the differences in weathering between HDPE grass blades in a synthetic turf and an HDPE geomembrane will provide additional insight into the similar half-life predictions of the two geosynthetics. Finally, the service life of the HDPE grass blades in the ClosureTurf® system should ideally be based on its performance requirements rather than a half-life which will result in a longer service life prediction.

In addition to the HDPE grass blades, there are two unexposed elements of the ClosureTurf® system: (i) the PP geotextile backing for turf component; and (ii) the Super Gripnet® which consist of a HDPE geomembrane (see Figure 1).

Watershed has incorporated UV degradation inhibitors into the PP geotextile backing which, according to Watershed has lead to an improvement in UV resistance by a factor of 14 over the original prediction of 65% retained tensile strength after 100 years (Watershed, 2014). Koerner (2011) has estimated that covered HDPE geomembrane will have a half-life of 446 years at 20 degrees Celsius and 265 years at 25 degrees Celsius.

Therefore, the most critical component of the ClosureTurf® appears to be the exposed HDPE grass blades when it comes to UV degradation. However, degradation of the HDPE grass blades to unserviceable levels can be remediated by replacement of the turf component of the ClosureTurf® system.

BACKGROUND AND LITERATURE REVIEW SUMMARY

In total, Geosyntec has reviewed approximately 40 technical documents to date. The database is a combination of documents provided to Geosyntec by Watershed as well as documents collected by Geosyntec. A complete reference list of the documents in the database can be made available upon request.

In general, relatively little information was found on the topic of exposed HDPE grass blades with respect to degradation due to UV radiation. The documents that were obtained and reviewed are listed below.

1. Field test data provided by Watershed from the New River, Arizona testing facility on the HDPE grass blades (Watershed, 2014).

2. Testing results (Atlas-MTS) discussing the UV longevity of polyethylene and polypropylene grass used for outdoor European athletic facilities.

3. Technical paper by Richgels, *et al.* (2015a) published in the conference proceedings for Geosynthetics 2015 in Portland, Oregon.

4. Presentation by Richgels., C. at the Geosynthetics Conference for 2015 in Portland, Oregon (Richgels, 2015b).

5. Presentation by Diguilio, D. at the Northern New England SWANA Conference on 25 September 2013 (Diguilio, 2013).

The following documents on the topic of HDPE Geomembrane degradation due to UV exposure were reviewed and found to contain useful information regarding this assessment.

1. Geosynthetic Research Institute (GRI) White Paper #6 (Koerner *et al.*, 2011). This white paper contained degradation data (% retained strength and elongation) on laboratory aged samples of 1.5 mm HDPE geomembrane. Aging was completed using a UV Fluorescent device per ASTM D7238 at 70 degrees Celsius (^{o}C).

2. Geosynthetic Institute (GSI) webinar presentation by Koerner *et al.*, (2015). This presentation contained a slide that compared predicted (laboratory vs. field) half-life of geomembranes of various resins, including HDPE, as well as a suggestion for estimating lower bound half-life.

3. Journal paper authored by Rowe *et al.* (2010) published in the Journal of Geotechnical and Geoenvironmental Engineering.

DISCUSSION OF DOCUMENTS AND DATA

The data from the New River, AZ testing facility on the artificial grass component of ClosureTurf® (Watershed, 2014) appears to be the only data set of its kind in our compiled database. The data consists of tensile property testing from field samples exposed to the Arizona environment at approximate exposure periods of 1, 5, 7 and 10 years. At each of the four exposure periods, 20 samples were tested for a total of 80 tests. The average values for tensile strength retained at each corresponding time period is 97%, 90%, 84% and 83%, respectively (Figure 2).

One additional data point was found in the Atlas-MTS document. That data point indicated that approximately 90% of tensile strength of polyethylene grass would be available after 20 years of field exposure assuming average European climatic conditions (temperature, irradiance, etc.). However, the average European irradiance is approximately one-half to one-third that of Arizona (Figure 3) notwithstanding temperature effects. Therefore, the Atlas-MTS data point will be consistent with the data from the New River, AZ facility in the 7 to 10 year time frame once adjusted for the relative levels of exposure and temperature between Europe and Arizona. As such, this data point will not extend the exposure duration covered by the New River, AZ data.

The paper and corresponding presentation by Richgels (2015a, 2015b) utilized the laboratory data released from the GSI on UV degradation of HDPE samples to make upper and lower bound estimates of the field half-life of the HDPE grass blades. The upper bound method utilizes Arrhenius

modeling of lab data to project exposure times at half-life to site temperatures combined with ratios of UV irradiance between the laboratory lamp and monthly average irradiance at New River, AZ to develop half-life loss per month. A similar procedure using a linear extrapolation (rather than Arrhenius) was demonstrated for a lower bound estimate. The Watershed (2014) field data set was plotted in between the upper and lower bound estimates. This method is further discussed in the section below titled, "HDPE Grass Blade Service Life Calculations".

Koerner *et al.* (2011) discusses the UV longevity of both exposed and unexposed geomembranes made from various resins, including HDPE based on GSI's laboratory testing program. This document is particularly useful in regard to the ClosureTurf® elements that are considered non-exposed (i.e., the PP geotextile backing for the turf component and the underlying HDPE geomembrane).

The presentation by Koerner *et al.* (2015) includes estimates of half-life of exposed HDPE geomembranes as well as a recommendation for linear data extrapolation as a lower bound limit that was implemented by Richgels (2015b).

PERFORMANCE REQUIREMENTS

The definition of service life of an HDPE (or other resin) geosynthetic (grass blades and geotextiles/geomembranes) typically invokes the half-life criteria. However, the half-life criteria is arbitrary and while useful as a general indicator for comparison it does not directly relate to any aspect of field performance for ClosureTurf® or any other geosynthetic. Therefore it is more appropriate to define the service life in terms of field requirements placed on the material.

HDPE Grass Blades

For the case of the HDPE grass blades on the ClosureTurf® system, tensile strength requirements fall in the range of 2.5 to 3.5 lbs, based on applied loads of pullout forces from equipment operation and water runoff forces (Diguilo, 2013). The ClosureTurf® HDPE grass blades are manufactured with 20 lbs. of tensile strength immediately following the process (Diguilo, 2013). Therefore, without considering a factor of safety, the required tensile strength of the HDPE grass blade is equal to approximately 12.5% to 17.5% of original strength capacity.

PP Geotextile Backing and HDPE Geomembrane

Performance requirements for the PP geotextile backing and HDPE geomembrane depend on more site-specific parameters (e.g., steepness of slopes, seismicity, etc.) than the HDPE grass blades. Therefore until a parametric study is completed which will define the performance requirements over a range of expected conditions, the half-life will have to be used as a benchmark for degradation of the PP geotextile and HDPE geomembrane.

HDPE GRASS BLADE SERVICE LIFE CALCULATIONS

In order to develop a prediction for the longevity of the HDPE grass blades with respect to UV degradation, Geosyntec implemented the method found in Richgels (2015a, 2015b) for two levels of retained tensile strength. The first level is the 50% of tensile strength, or half-life, criterion that is commonly used as a benchmark for geosynthetic service life. Geosyntec performed this calculation to compare our results with the results presented by Richgels (2015a, 2015b). Once the half-life estimates were calculated, Geosyntec attempted to repeat the calculations using a retained tensile strength of 12.5% of an HPDE grass blade.

Half-Life Estimation (50% of Retained Strength)

The assessment utilized by Richgels (2015a, 2015b) begins with a laboratory data release from GSI (Figure 4). The data includes retained tensile strength of HDPE samples that have been incubated under a UV lamp at elevated temperatures, which accelerates the UV weathering process in accordance with ASTM D7238.

As mentioned, the GSI data includes samples tested at three elevated temperatures: (i) 80 degrees Celsius (^{o}C); (ii) 70^{o}C; and (iii) 60^{o}C. The testing program appears to have originally included only the 70^{o}C data, with the 80 ^{o}C and 60^{o}C testing added at a later date (therefore, weathering is not as advanced). The 70^{o}C data set has reached approximately 66%, while the 80^{o}C and 60^{o}C data sets have reached approximately 78% and 86%, respectively. Nonetheless, logarithmic extrapolations to 50% retained strength were performed for each data set. The amount of exposure time (on a log scale) corresponding to the 50% retained strength plotted vs. the inverse of the corresponding temperature (80^{o}C, 70^{o}C and 60^{o}C) is shown in Figure 5. Figure 5 allows for extrapolation to find the laboratory exposure time required to achieve 50% retained strength at temperatures lower than the test temperatures (i.e., actual field temperatures).

Once the curve is defined relating any temperature to a level of laboratory lamp exposure, the remaining task is to develop a relationship between laboratory exposure and field exposure for a

particular site. In this case, the testing site in New River, AZ where Watershed has performed tests on HDPE grass blades, was selected.

Richgels (2015a, 2015b) presents monthly averages at the site for: (i) peak turf temperature; and (ii) irradiance as a fraction of the laboratory lamp irradiance. Using these two values for a given month combined with the Arrhenius model, an estimate of half-life loss per month is obtained. Summation of the half-life lost per month over a year yields the annual half-life loss. The inverse of the annual half-life loss is the predicted half-life in years. Using this method, Richgels obtains a half-life of approximately 247 years, while Geosyntec obtained a half-life of 277 years using the same data (Table 2). The difference is attributable to rounding errors in the logarithmic projections.

Following the suggestion of Koerner *et al.* (2015), Richgels (2015b) treated the results of the half-life mentioned above as an upper bound estimate. For the lower bound estimate, Koerner *et al.* (2015) suggests performing a linear extrapolation of the laboratory data to lower field temperatures, rather than using the Arrhenius model.

With the linear extrapolation, the ratio of monthly irradiance to laboratory lamp irradiance is scaled linearly to calculate the number of months required to reach half-life at 80C, 70C and 60C. Linear extrapolations per month are made from the elevated temperatures to the corresponding peak turf temperature in that month. The resulting half-life loss per month is summed to obtained half-life loss per year. The inverse of that result is the half-life in years. Richgels (2015b) calculates a half-life of 176 years using this linear model. Geosyntec's calculation using the same data resulted in a half-life of 214 years (Table 3 and Figure 6). The difference in the calculations is approximately the same as with the calculation using the Arrhenius (logarithmic) model.

Figure 7 shows the calculated upper (Arrhenius - logarithmic) and lower (linear) bound curves calculated by Richgels (2015b) along with the field data on the HDPE grass blades provided by Watershed (2014). As shown in Figure 7, the trend line fit to the field data falls in between the upper and lower bound curves produced by Richgels (2015b). Note that the first point from the field data at approximately 1 year is omitted from the trend line. This is because the first data point is assumed to be within the anti-oxidant phase of degradation rather than the polymer oxidation stage as suggested by Rowe *et al.* (2010). Additional discussion regarding the stages of degradation for polyolefin materials can be found in CUR 243 (2012).

Service Life Estimation Based on Performance Requirements (12.5% of Retained Strength)

Geosyntec repeated the calculations discussed above for the estimation of half-life, but extrapolated the GSI laboratory data down to 12.5% rather than 50% at 80C, 70C and 60C. Upper bound

(Arrhenius – logarithmic) and lower bound (linear) estimates were 2,500 years and 2,043 years, respectively.

These estimates of service life are simply too large to be reasonable. A likely explanation is that the samples tested at 80C, 70C and 60C have not degraded enough to produce accurate predictions at 12.5% retained strength. As previously mentioned, the data for 80C has reached 78% retained strength; the data for 70C has reached 66% retained strength; and the data for 60C has reached 86% retained strength. Therefore, the extrapolation for each of these data sets to 50% retained strength will be much more accurate than extrapolations to 12.5%. In addition, small uncertainties in log-based extrapolations will greatly influence results.

For these reasons, it is not practical or useful at this time to quantitatively assess service life in terms of actual performance requirements when those requirements are substantially below the half-life. There is some value, however in a qualitative use of performance requirements in comparisons with half-life estimates (i.e., to establish the factor of safety remaining at 50% degradation).

SUMMARY AND CONCLUSIONS

Geosyntec's literature review of approximately 40 documents yielded few sources of UV degradation data for exposed HDPE grass blades. Relevant data that was found included the field test data from the New River, AZ testing facility provided by Watershed (2014) and one data point from Atlas-MTS. The Atlas-MTS data point indicated that HDPE grass blades in average European climatic conditions would retain approximately 90% of its original strength after 20 years of field exposure. Taking into account the differences in temperature and UV irradiance between New River, AZ and European averages, the data point is consistent with the New River, AZ test data in the 7 to 10 year range.

Following the method presented in Richgels (2015a, 2015b) for HDPE grass blades, Geosyntec calculated an upper bound half-life of 277 years compared with Richgels 247 years using the Arrhenius (semi-log) extrapolations to site temperatures and ratio of laboratory lamp to field irradiance. Geosyntec calculated a lower bound half-life based on linear temperature extrapolations, as suggested by Koerner *et al.* (2015), of 214 years compared with 176 years obtained by Richgels (2015b). The differences between Geosyntec and Richgels calculations were attributed to rounding. As shown in Figure 7, the field data from New River, AZ suggests a half-life of 216 years when considering only the last three data points (i.e., polymer oxidation stage).

Another prediction of HDPE grass blade degradation is included in Watershed (2014) using the same (New River, AZ) field data. That prediction of retained tensile strength at 100 years of service life is 65%.

Therefore, it appears that the half-life of the HDPE grass blades will be on the order of 100 years based on the existing field data set and extrapolation methods found in the literature and presented herein. The results are promising; however additional field test data is needed to improve the half-life prediction, particularly since the half-life predictions for exposed HDPE geomembranes are also approximately 100 years (Koerner, 2015). Half-life predictions presented herein will also need to be revisited when additional labratory data is released from the GSI testing program.

Geosyntec attempted to calculate the service life of the HDPE grass blades using 12.5% of retained strength, rather than an arbitrarily assigned half-life. However, the calculation resulted in unreasonably long service life. This result is likely due to uncertainties in extrapolating the laboratory data released from GSI down to the 12.5% retained strength level. The data release has degraded to 78%, 66% and 86% for the 80 ^{o}C, 70 ^{o}C, and 60 ^{o}C test temperatures. Therefore, extrapolations to 50% may be warranted while extrapolations to 12.5% may not be until additional lab data is available. That being said, it should be recognized that half-life, or 50% of retained strength, has a factor of safety of 2.8 to 4.0 when considering the tensile capacity performance requirements of HDPE grass blades.

With regard to the unexposed elements of the ClosureTurf® system, Watershed (2014) indicates that the retained tensile strength of the PP geotextile backing prior to the addition of UV inhibitors is 65% after 100 years. This estimate is based on exhumed samples of the geotextile from the LaSalle-Grant Landfill in Louisiana. According to Watershed (2014), the addition of proprietary UV inhibitors to the PP geotextile backing has led to an improvement in UV resistance by a factor of 14. The final geosynthetic in the ClosureTurf® system is the covered HDPE geomembrane. Koerner (2011) estimates that the half-life of a covered HDPE geomembrane is 446 years at 20C, and 265 years at 25C. Furthermore, the degradation of the unexposed elements of the ClosureTurf® system invoke the half-life criteria. As discussed with regard the exposed HPDE grass blades, actual performance requirements should ideally be used to determine system longevity. However, the existing testing programs need to be allowed to degrade further before projections to lower values are made.

It is worth reiterating that applications of ClosureTurf® in areas of the United States where the UV irradiance and the temperatures are lower will result in longer half-life predictions than discussed above. In some cases (e.g., the Northeastern States), the differences will likely be quite large when compared with Arizona.

Finally, once UV degradation of the most susceptible component of ClosureTurf® (i.e., the exposed HDPE grass blades) does result in a tensile break, replacement of the HDPE grass and PP geotextile backing can be performed.

CLOSING

Geosyntec appreciates the opportunity to assist Watershed in the development of its ClosureTurf® products. Questions and comments may be directed to either of the undersigned at 678-202-9500.

Sincerely,

Will Tanner, P.E.
Project Engineer

Fire Resistance

WG WatershedGeo®
Unearthing Solutions®
ClosureTurf®
Fire Resistance Testing

Test Highlights

Site owners must provide corrective action cost estimates for wildfire dangers. Vegetated surfaces provide fuel for fire propagation to other combustible structures such as gas collection systems. ClosureTurf® does not have the same fire exposure as vegetative caps as shown in the following slides. In short:

- **None of the ASTM studies burned through the Super Gripnet component of ClosureTurf®. This positive result is important when considering active gas control may be near the site perimeter where burning embers may fall.**
- **ClosureTurf® demonstrated performance results that would qualify it as Class C rated fire resistant in a qualified laboratory test. Depending on the interpretation of ASTM E108 failure modes, it may even be classifiable as Class A fire resistant when applied at landfills.**

ASTM E108 was conducted to test the fire resistance of ClosureTurf®

- ASTM Test Method E108 was originally designed to test asphalt composite roof shingles for fire resistance.
- This investigation performed the Burning Brand Test (Section 10 of ASTM E108)
- Test conducted with 3 different brand sizes, Class A, B and C.

Brand Construction

Brands constructed using nominal 1x1 (¾ ” x ¾” finished) pine stock. Strips were spaced ¼” apart. Class A brand built with 36 each 12” long strips. Class B brand built with 18 each 6” long strips. Class C brand made with 1-1/2” long piece of 2x2 pine stock with perpendicular saw kerfs on opposite sides per ASTM E108 specifications.

Brand Curing

ASTM E108 specifications recommend curing the brands in an oven for 24 hours at an oven temperature between 105°F and 120°F. These brands were cured at 150°F overnight.

Test Pad Preparations

Subgrade was stripped of vegetation and bladed smooth with a straight shovel. ClosureTurf® test pads were prepared using dimensions specified in ASTM E108 – 4’-4” by 3’-4”

Sand Ballast Application

Each test pad received 60 pounds of a medium to coarse sand in accordance with ClosureTurf's recommended sand infill specification. This is an equivalent unit weight of 5 psf spread to approximately ½" deep. The sand was poured evenly over the pads and raked in place per manufacturer's installation guidelines.

Class A brand applied

The Class A brand was ignited over briquettes in a kettle-style grill. Each large face was placed on coals for 30 seconds. Each side face was placed on coals for 45 seconds each. The brand was fully aflame after side face coal applications.

Class A brand Fully Involved

Note melted turf blades in immediate proximity of brand. The turf did not ignite nor self-propagate fire away from brand. Slight wind developed during test fanning flames to one side.

Class B Brand Test

The Class B brand was ignited over briquettes in a kettle-style grill. Each face was placed on coals for 30 seconds.

Class C Brand Test

The Class C brand was ignited over briquettes in a kettle-style grill. Four of the brand faces was placed on coals for 30 seconds for a total of 2 minutes of coal exposure.

Brand Tests Nearing Completion

The Class A brand finished burning with open flame approximately 30 minutes after placement. No fire propagation away from brand to the ClosureTurf occurred. Class B and C brand tests achieved same results.

Post Fire Inspections

Class A Brand

The Class A brand was nearly entirely consumed. Only a few small pieces of brand were left after fire test completion. Grass tufts were melted up to 3 inches away from brand edge in melt zone. Sand discolored under brand within burn zone.

Class A Brand Test

Downwind side of Class A brand exhibited slightly larger melt zone – up to 5 inches.

Class A Brand Test

Upon peeling back the turf component, it was found the turf had melted on to the Super Gripnet geomembrane (SGN) in the burn zone. Observe the studs in the drainage matrix. Those were intact up to the boundary of the brand. The entire system was pulled back to observe if the fire had burned through the SGN.

Class A Brand Test

The underside of the SGN displayed observable effects from the fire but was not broached. The burn zone boundary is being pointed out. Observe the wet conditions of the subgrade by the condensed water in the upper left corner of the photo. Some of the soil beneath the burn zone was dry and adhering to the SGN. Spikes beneath the burn zone were gone, while spikes in areas immediately neighboring the burn zone were intact.

Class A Brand Test

The Class A brand burn zone damage to the SGN was essentially the dimensions of the brand – 12” x 12”. Note the studs in the immediate vicinity of the burn zone were completely intact. The SGN exhibited some deformation from the burn zone causing the undulations observed. Studs with the burn zone were flattened.

Class A Brand Test

Close up views of burn zone boundary. Turf melted on to SGN and underside of SGN. Note studs on upper side and spikes on underside were intact and totally unaffected by the fire.

Class B Brand Test

The Class B brand was also nearly entirely consumed. Only a few pieces of brand left after fire test completion. Grass tufts were melted up to 3 inches away from brand edge. Sand discolored under brand but retained natural color within melt zone. Note larger melt zone on downwind side of brand (5”).

Class B Brand Test

Sand discoloration beneath the burn zone was also observed in the Class B brand test. The underside of the SGN displayed observable melting from the fire but was not broached. Again dry soil was found adhering to the SGN underside even though the subgrade was moist at test commencement.

Class B Brand Test

The Class B brand melt zone was slightly larger than the dimensions on the brand – 7-1/2" 7-1/2". Note the studs in the immediate vicinity of the burn zone were completely intact. Studs with the burn zone were flattened.

Class C Brand Test

The Class C brand was stuck to the underlying grass tufts after the fire had gone out. The brand was not fully consumed by the fire. Note sand discoloration under the brand and minor melting of nearby grass tufts .

Class C Brand Test

The Class C brand displayed no melting affect on the woven geotextile component in the turf. There were no observable impacts to the SGN either.

Summary

Site owners must provide corrective action cost estimates for wildfire dangers. Vegetated surfaces provide fuel for fire propagation to other combustible structures such as gas collection systems. ClosureTurf® does not have the same fire exposure as vegetative caps as shown in the following slides. In short:

- **None of the ASTM studies burned through the Super Gripnet component of ClosureTurf®. This positive result is important when considering active gas control may be near the site perimeter where burning embers may fall.**
- **ClosureTurf® demonstrated performance results that would qualify it as Class C rated fire resistant in a qualified laboratory test. Depending on the interpretation of ASTM E108 failure modes, it may even be classifiable as Class A fire resistant when applied at landfills.**

Aerodynamic Testing

AERODYNAMIC UPLIFT PROPERTIES TESTING OF CLOSURETURF® SYSTEM

Extensive independent, third party aerodynamic testing has been performed on ClosureTurf® at the Florida International University Wall of Wind Experimental Facility at the International Hurricane Research Center in Miami, Florida, the Georgia Tech Research Institute Aerospace, Transportation and Advanced Systems Laboratory in Atlanta, Georgia, and at ViGYAN, a private research facility located in Hampton, Virginia since 1979. A description of aerodynamic testing procedures and test results are provided in this document. Additional testing and evaluations performed on ClosureTurf include steady state hydraulic performance of infill movement and multiple other performance and material properties tests. Those testing descriptions and results are available in separate documents. Please contact Watershed Geosynthetics for additional information.

FULL-SCALE AERODYNAMIC EVALUATIONS

ClosureTurf was tested for three distinct aerodynamic performance characteristics at three different facilities. Testing at the Florida International University Wall of Wind Experimental Facility determined ClosureTurf performance in a "worst-case scenario" when installed on a flat roof. Georgia Tech Research Institute testing determined aerodynamic lift and drag forces acting on the tufted geosynthetic around the perimeter and at the interior of an installation. And, the ViGYAN facility tested ClosureTurf response to wind gust conditions.

WALL OF WIND

The Wall of Wind Experimental Facility at the International Hurricane Research Center is an open jet wind tunnel with a combined 12-fan system capable of repeatable testing at wind speeds up to 157 miles per hour. The full-scale ClosureTurf test was designed to evaluate infill options for roof installations in worst-case scenarios of an installation on a flat roof, high wind speeds (up to facility capacity), critical wind attack angle and parapet wall height ratio

11400 Atlantis Place Ste 200
Alpharetta, GA 30022
770-777-0386
www.watershedgeo.com

Wall of Wind testing was conducted on a square, wooden building covering approximately 125 square feet and measuring five feet tall built on a rotating platform. The simulated roof was constructed atop the building using plywood sheathing, free floating foam board (allowing uplift) and ClosureTurf® with pea gravel infill. A 16-inch-high parapet surrounded the roof perimeter creating a worst-case building-to-parapet height ratio of 0.12 as previously identified by others[1]. The completed test structure is presented in Figure 1.

Figure 1: ClosureTurf® Wall of Wind Test Installation

The test procedure utilized a wind profile representative of open terrain exposure, and a wind attack angle directly impinging the building face was considered zero degrees. Five wind attack angles were tested as presented in Figure 2. Tests began at a wind speed of 20 miles per hour and attack angle of zero degrees. At each tested attack angle, wind speed was incrementally increased each minute to the facility maximum wind speed, provided no observable lift or imminent failure was observed. The maximum average 1-minute wind speed was 150 miles per hour and the maximum 3-second gust was 151 miles per hour. Wind patterns and outlines of vortices were visible during testing. Testing in progress is presented in Figure 3. There was minimal gravel movement and no appreciable loss of infill. Infill thickness remained consistent across the roof and there was no evidence of scarifying of the infill. ClosureTurf would make an excellent lightweight roof ballast and protection system, even in hurricane prone areas.

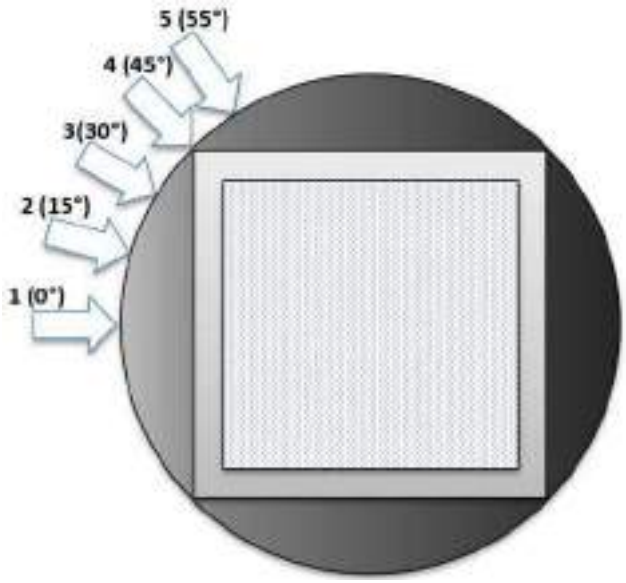

Figure 2. ClosureTurf® Wind Attack Angles at the Wall of Wind

Figure 3. ClosureTurf® Wall of Wind Testing in Progress

GEORGIA TECH RESEARCH INSTITUTE

The Georgia Tech Research Institute (GTRI) Aerospace, Transportation & Advanced Systems Laboratory subsonic model test facility tested the aerodynamic properties and ballast requirements of the tufted geosynthetic component of ClosureTurf® at wind speeds up to 118 miles per hour. The full-scale test was designed to evaluate lift and drag forces acting on the tufted component of an installation around the perimeter and on an interior section. Results were used for determining required infill thickness to counteract wind induced aerodynamic lift

The tufted component was tested in two configurations. The first test represented the perimeter of an installation. The second configuration represented the interior area away from the perimeter. Both installations were tested on a flat, level surface representative of level terrain.

GTRI testing was conducted on a 43 x 6 1/8 inch (width x length) full-scale installation. A plywood support base was overlain with foam representing a soil layer. The foam was covered with the geomembrane followed by tufted geosynthetic. During interior condition testing, larger installations were placed immediately upstream and downstream of the test section. During perimeter condition testing, the upstream tufted material was removed exposing the test section perimeter. The test configuration is presented in Figure 4.

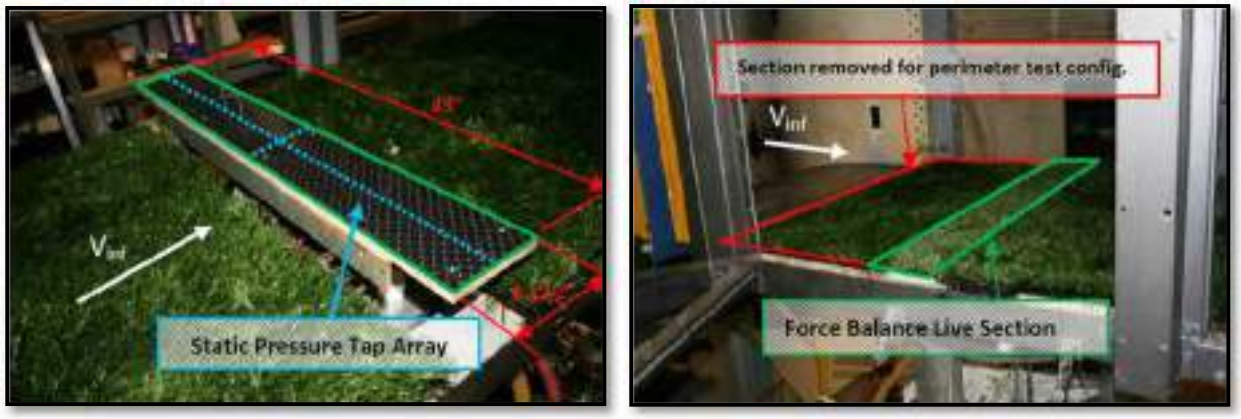

Figure 4. ClosureTurf® GTRI Test Configuration

Test results were surprising: higher velocities produce less lift and require less infill material. Figure 5 presents perimeter condition testing in progress at 118 miles per hour (174 feet per second). The inset figure displays the perimeter lift force data measurements increasing at lower velocities, peaking at approximately 44 miles per hour (65 feet per second) and steadily decreasing. Interior conditions exhibited a similar increasing/decreasing lift force pattern.

The ClosureTurf® system disruption of the boundary layer and downward flexing blades naturally decrease system uplift at higher velocities. These properties in conjunction with infill, produce a stable installation in hurricane force winds when properly designed, constructed and maintained

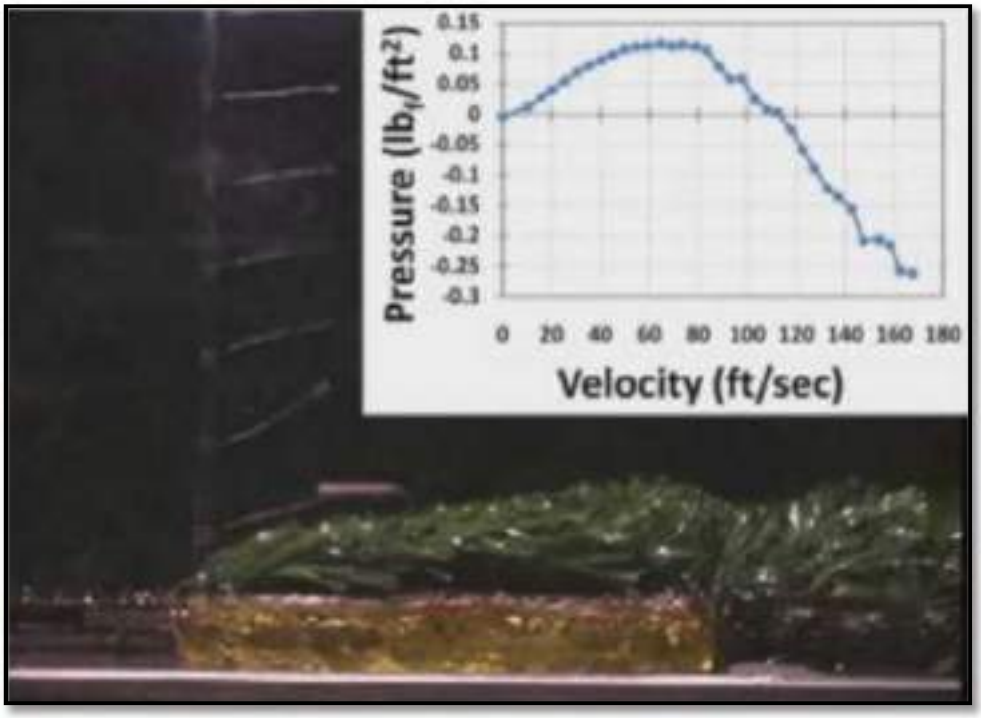

Figure 5. ClosureTurf® Lift and Drag Testing at GTRI

ViGYAN

The ViGYAN Inc. wind tunnel is located in the Aero-Fluids Laboratory building at the Langley Research and Development Park in Hampton, Virginia. The open return design tunnel has been serving the aerodynamic testing requirements of government agencies and commercial customers since 1988 in addition to supporting on-going, internal research and development. The full-scale testing assessed resilience of an interior section of the ClosureTurf® tufted geosynthetic component to a sudden gust of wind.

ViGYAN testing was conducted on a plywood base measuring 4 feet by 6 feet (width x length). Three sections of tufted geosynthetic each measuring two feet wide (6 feet total) were installed on a plywood base. The upstream and downstream sections were secured to the plywood base with heavy duty double-sided tape. The middle section was secured to the plywood base at the downstream edge, only. As a safety precaution, thin wire was also secured across the sample to prevent the sample from blowing down the tunnel if it were to pull completely away from the ground board. The product installation is presented in Figure 6 prior to placement in the wind tunnel.

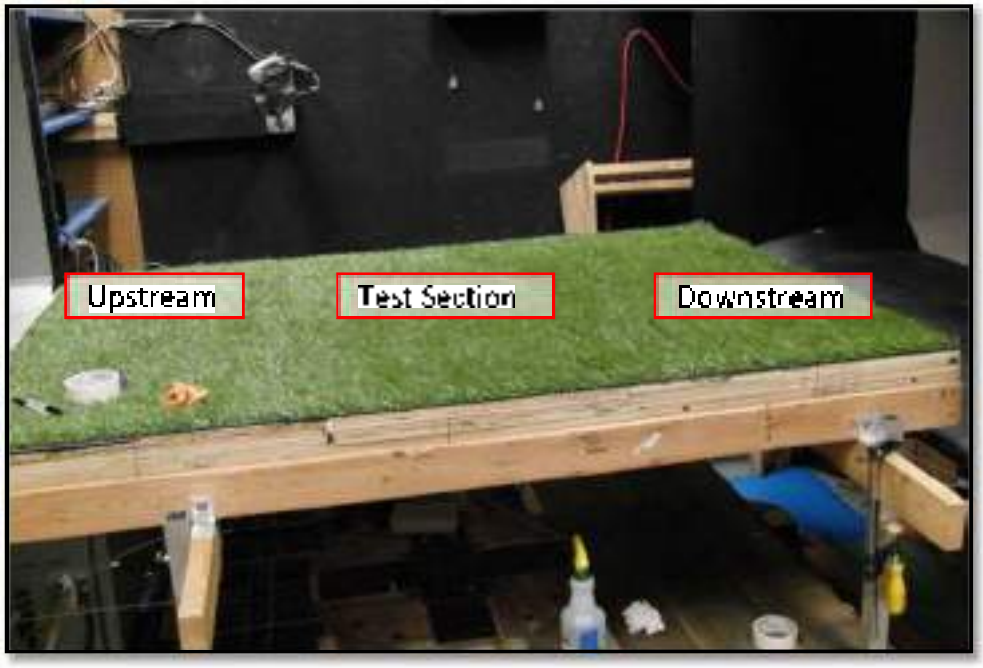

Figure 8. ClosureTurf® Wind Gust Testing at ViGYAN

During testing, three video cameras recorded the installation with instantaneous wind speed overlain on the video feed. One of the cameras was positioned to provide a side view of the installation to capture any movement should movement occur. Initial wind speed was approximately 26 miles per hour. Once a wind gust began, peak wind speed for the gust was attained within 2-3 seconds.

After 22 wind gust tests and a maximum gust speed of 110 miles per hour, the tufted geosynthetic did not pull away from the installation. The installation remained in place.

LIMITATIONS

ClosureTurf® is a U.S. registered trademark which designates a product from Watershed Geosynthetics LLC. This product is the subject of issued U.S. and foreign patents and/or pending U.S. and foreign patent applications. All information, recommendations and suggestions appearing in this literature concerning the use of our products are based upon tests and data believed to be reliable. However, this information should not be used or relied upon for any specific application without independent professional examination and verification of its accuracy, suitability and applicability. Since the actual use by others is beyond our control, no guarantee or warranty of any kind, expressed or implied, is made by Watershed Geosynthetics LLC as to the effects of such use or the results to be obtained, nor does Watershed Geosynthetics LLC assume any liability in connection herewith. Any statement made herein may not be absolutely complete since additional information may be necessary or desirable when particular or exceptional conditions or circumstances exist or because of applicable laws or government regulations. I. PURPOSE

The purpose of this analysis is to evaluate the veneer stability of the proposed final cover system at the DB Wilson Station Special Waste Landfill Facility by evaluating shallow translational failure potential in those areas. These calculations are being provided in response to the NOD – No. 3, pursuant to 401 KAR 45:110 Section 5(2)(e), dated July 2, 2021, and in compliance with the Environmental Protection Agency's (EPA) *Disposal of Coal Combustion Residuals From Electric Utilities, Final Rule* (CCR Rules), which became effective October 14, 2015. The CCR Rules state that there should be a stability assessment of aboveground embankments and that the closure must provide for major slope stability to prevent the sloughing or movement of the cover system during closure and throughout the post-closure care period.

This analysis is intended to determine the minimum shear strength parameters necessary to maintain stability of the final cover system based on the minimum required factors of safety for shallow uniformly loaded slopes. Typically, these values are used in specifications for future construction.

II. SITE AND PROJECT DESCRIPTION

The shallow translational failure analysis is performed as part of the Special Waste Landfill Closure Plan and Groundwater Corrective Action Permit Application for the existing landfill site located approximately 3,000 feet north of Kentucky Route 85 and east of the Green River in Centertown, Kentucky.

The following sections summarize the methodology, assumptions, and results of the shallow translational failure analysis. For further detail on the specific calculations performed, refer to the corresponding data provided in the Attachments.

III. CONFIGURATION OF THE FINAL COVER SYSTEM

Shallow translational/veneer stability was analyzed for the ClosureTurf® final cover system. Conservative assumptions and parameters for the stability models were chosen for each of the analyses, including modeling the maximum design grades and longest typical design slopes. **Figure 1** depicts the final cover system based on the proposed facility design.

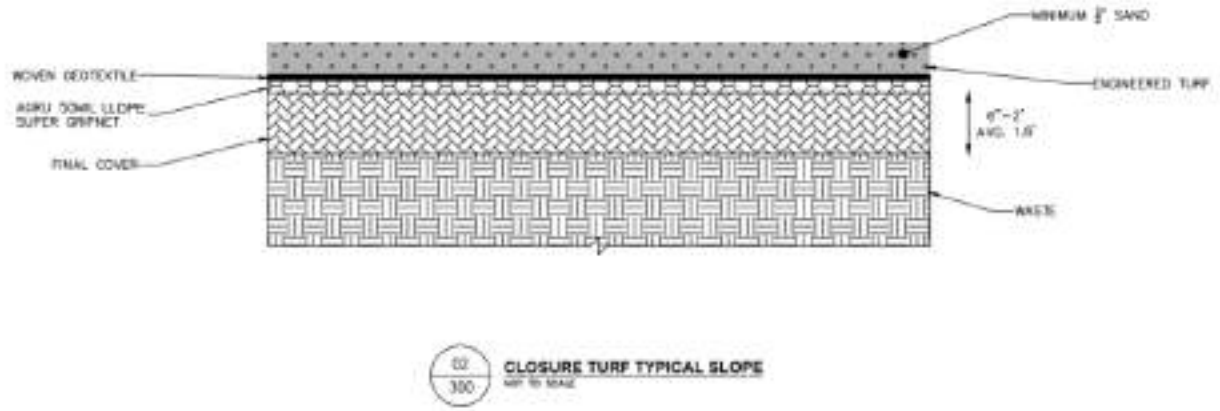

Figure 1. DB Wilson Station Phase I Final Cover Detail Design

IV. SHALLOW TRANSLATIONAL FAILURE ANALYSIS – METHODOLOGY

Analysis of the sliding potential of relatively thin cover soil layers (veneer) above both geosynthetic and subsurface soils (i.e. geomembranes (GM), geosynthetic clay liners (GCL), geocomposite) is important. This is because the underlying barrier materials generally represent a low interface shear strength boundary with respect to the soil placed above them, and the geosynthetics are oriented precisely in the direction of potential sliding.

The method used in this analysis closely follows the methods outlined by Koerner and Soong (Koerner and Soong, 2005). The analysis is performed by use of force equilibrium to balance the driving forces due to gravity pulling on the cover soils and the resistance to sliding due to friction between the underlying subsurface and cover material. Resistance to sliding is also due in part to the toe support (passive wedge) located at the base of the sliding mass. This is conceptually illustrated in **Figure 2**.

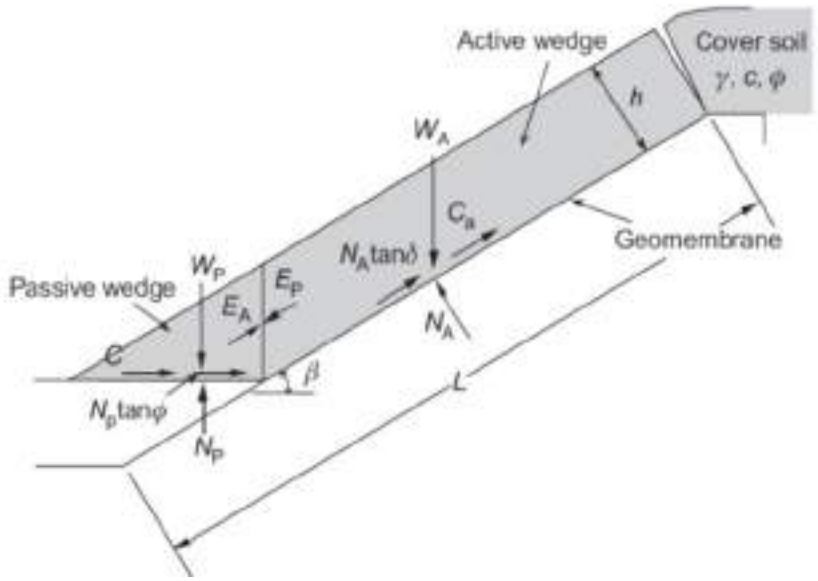

Figure 2. Conceptual Veneer Stability Analysis Cross Section/Free Body Diagram

Where,

W_A = Total Weight of the Active Wedge
W_P = Total Weight of the Passive Wedge
N_A = Effective Force Normal to the Failure Plane of the Active Wedge
N_P = Effective Force Normal to the Failure Plane of the Passive Wedge
γ = Unit Weight of the Cover Soil
h = Thickness of the Cover Soil
L = Length of Slope Measured Along the Geomembrane
β = Soil Slope Angle Beneath the Geomembrane
ϕ = Friction Angle of The Cover Soil
δ = Interface Friction Angle Between Cover Soil and Geomembrane
C_a = Adhesive Force Between Active Wedge Cover Soil and Geomembrane
c_a = Adhesion Between Active Wedge Cover Soil and the Geomembrane
C = Cohesive Force Along the Failure Plane of The Passive Wedge
c = Cohesion of the Cover Soil
E_A = Interwedge Force Acting on the Active Wedge from the Passive Wedge
E_P = Interwedge Force Acting on the Passive Wedge from the Active Wedge
FS = Factor of Safety Against Cover Soil Sliding on the Geomembrane

The shallow translational failure analysis is analyzed by fully satisfying the equilibrium of forces in the vertical and horizontal directions. By taking force summation parallel to the slope and comparing the resisting force with the driving or mobilizing force, a global factor of safety (FS) results:

$$FS = \frac{\sum \text{Resisting Forces}}{\sum \text{Driving Forces}}$$

As noted in the procedure contained in the Koerner and Soong paper, the FS for veneer stability (as depicted in **Figure 2**) is determined by solving the following quadratic equation:

$$FS = \frac{-b + \sqrt{b^2 - 4ac}}{2a}$$

Where,

$$a = (W_A - N_A cos\beta)cos\beta$$

$$b = -\begin{bmatrix} (W_A - N_A cos\beta)sin\beta tan\varphi \\ +(N_A tan\delta + C_a)sin\beta cos\beta \\ +sin\beta(C + W_P tan\phi) \end{bmatrix}$$

$$c = (N_A tan\delta + C_a)sin^2\beta tan\phi$$

When the calculated FS value falls below 1.0, sliding of the cover soil on the geomembrane is to be anticipated.

Typically, slope stability analyses require a static FS between 1.4 and 2.0 (or potentially higher if unknown conditions warrant it). A FS of 1.5 is commonly used for landfill cap and liner systems designed for long term static conditions and peak strength. For short term conditions, a lower FS is usually warranted commensurate with the consequences of failure and the duration of the temporary condition. A lower FS is also warranted where residual strength parameters are used in the analysis.

For this analysis, the following loading conditions and factors of safety were considered based on the anticipated probability and consequences of failure and are explained further below:

- Static Conditions (Peak Strength): FS ≥ 1.50 (long term conditions)
- Static Conditions (Full Drainage Layer): FS ≥ 1.10

- Static Conditions (Equipment Loads): FS ≥ 1.25
- Seismic Conditions: FS ≥ 1.00
- Static Conditions (Residual Strength): FS ≥ 1.10

An FS of 1.5 was used for the final cover system static analysis utilizing peak strength.

The remaining analyses and the corresponding factors of safety represent temporary or extreme conditions, where a lower FS is warranted. These conditions exist where:

- Significant deformation along the interface has occurred and residual strength conditions have been mobilized.
- A large storm water event has occurred, and the sand infill layer is not saturated or has no free water due to drainage capacity of the underlying Super Gripnet being greater than flow from the storm water event.
- Additional temporary forces act on the slope, such as construction equipment or a seismic event.

Based on the results of the ClosureTurf® hydraulic shear analysis, the total flow on the slope is less than the internal drainage capacity of the underlying Super Gripnet. Hence, the stability analysis, including seepage forces, assumes the infiltration from the design storm water event will be properly conveyed such that there will be no hydraulic head within the sand infill layer.

Also note that this analysis for equipment load only accounts for the weight of the vehicle and assumes very small and gradual acceleration and deceleration on the slope such that it can be neglected. It also assumes placement of the material beginning from the toe of slope progressing to the top.

V. SELECTION OF PARAMETERS

For the final cover system, the following assumptions and design parameters were used. Slope lengths and angles used in all analyses correspond to the most conservative cross-section and representative of existing landfill slopes.

a. Slope Geometry

The slopes of final cover system will be the same as existing slopes with a maximum slope of 3H:1V with intermittent surface water swales benched into the waste mass. Based on the final grades, which will be similar to existing grades, the average elevation change between the intermittent benches is approximately 30 feet and the maximum typical slope length is approximately 95 feet. For a holistic analysis, the entire landfill cap from toe to crest was also analyzed. However, due to the greater slope angle between

intermittent benches, the stability between the intermittent benches is considered the "worst case" condition.

b. Layers

Layers and layer thicknesses for the cover system are anticipated as follows:

Table 1. Layer Summary for the Final Cover System

THICKNESS	LAYER
Final Cover System	
n/a	Engineered Turf
0.5 in	Sand Infill
n/a	Agru 50mil LLDPE Super Gripnet (GM)
n/a	Existing Cover Soil (Sandy Silty Clay) *
n/a	CCR Waste

n/a – thickness of layer is small (negligible)
* Existing cover soil thickness ranges from less than 6 inches to more than 2 feet with an average of approximately 1.6 feet. New fill placement will be in 6 to 8-inch compacted lifts to achieve final grades, where applicable.

c. Critical Interfaces

The critical interfaces analyzed represent preferential pathways for mass sliding. Critical interfaces in the cover system are typically between adjacent geosynthetic materials or between geosynthetic and soil materials. The geosynthetics are of negligible thickness, so the depth to the failure surface does not require adjustment for the individual components when they are stacked.

For the final cover system, the critical interfaces analyzed are as follows:

- Geomembrane (GM)/Existing Cover Soil Layer (EC)

For each system, a minimum shear strength envelope was determined for each critical interface condition. The most conservative envelope developed from the various conditions is anticipated to be used to develop material specifications for use in construction.

d. Material Parameters

The various material parameters used in the veneer analyses are tabulated in **Table 2**.

Table 2. Final Cover and Bottom Liner Variables

PARAMETER	VALUE	COMMENTS
Final Cover		
Dry Unit Weight of Sand Infill, $\gamma_{D\text{-}CS}$	95 pcf	Assumed loose sand relative density
Moisture Content of Sand Infill, $w_{F\text{-}CS}$	0%	Assumed based on thin layer and exposure
Specific Gravity of Slope Cover Soil, G_S	2.55	Based on tested Sand Infill samples
Friction Angle of Sand Infill, ϕ	28 deg	Conservatively assumed for loose sand infill.
Cohesion of Sand Infill, c	0 psf	
PARAMETER	**VALUE**	**COMMENTS**
Equipment Loads		
Weight of Construction Equip (W_b)	39,918 lbs	CAT D6 LGP Dozer
Length of Equip. Track (w)	10.2 ft	CAT D6 LGP Dozer
Width of Equip. Track (b)	2.8 ft	CAT D6 LGP Dozer
Seismic Loads		
Seismic Coefficient (Cover)	0.135 g	Based on one half of site-specific crest PGA in accordance with the guidance presented in EPA Publication EPA/600/R-95/05 (Richardson, et al., 1995) titled “RCRA Subtitle D (258) Seismic Design Guidance for Municipal Solid Waste Landfill Facilities” to limit permanent seismic deformations to less than 1-foot.

VI. RESULTS OF ANALYSIS

The analysis consists of finding strength parameters (i.e., friction angle, ϕ and cohesion, c) for a given interface to meet required factors of safety against translational failure. In the case of geosynthetic interfaces, the term adhesion is used instead of cohesion. Cohesion strictly relates to clay particle interaction, whereas adhesion refers to the physical interaction of geosynthetic surfaces. Mathematically, these terms are interchangeable.

The results of the analysis are summarized below. Detailed calculations are included as **Attachment A**. The minimum peak and residual shear strength parameters for each condition are included in graphical form in **Attachment B**.

a. Final Cover System Shear Strength Parameters

Assuming cohesion/adhesion is equal to zero, the minimum required shear strength parameters for the final cover system are as follows in **Table 3** below. Additional minimum values where cohesion/adhesion are non-zero are included in **Attachment B.**

Table 3. Final Cover Minimum Calculated Required Friction Angle

CONDITION	PEAK INTERFACE FRICTION, ϕ (DEGREES)*	FACTOR OF SAFETY
Static (Gravitational Forces Only)	26.5	1.50
Static (Additional Seepage Forces)	20.1	1.10
Static (Equipment Loads)	22.6	1.25
Seismic	26.3	1.00

*Calculations of friction angles assume interface adhesion (c) is equal to zero.

The factor of safety for the gravitational forces only condition based on peak strength controls the veneer stability design of the final cover system.

In **Attachment A**, the factors of safety for the two static loading conditions (additional seepage forces and equipment loads) and the seismic loading condition were computed based on a minimum interface friction angle between the Agru 50mil LLDPE Super Gripnet and existing cover soil of 26.5 degrees, as determined by the controlling gravitational forces only loading condition. The actual minimum interface friction angle computed for each condition is shown in **Table 3**.

Preconstruction testing with actual materials is anticipated to be conducted to verify that the materials used exhibit interface properties above the minimum shear strength envelope.

b. Residual Strength

The acceptable material specifications are anticipated to be based on the materials' peak strengths. However, should the cover system be temporarily acted upon by an outside force that causes the post-peak strength to be mobilized, there may be some displacement of the cap system. Movement will occur along the interface with the lowest peak strength. This will then mobilize the residual/large-displacement strength of that particular interface. If residual strength for the interface with the lowest peak strength is

above the minimum shear strength envelope (as depicted in **Attachment B)**, the cap system is anticipated to stabilize after the temporary loading condition ends.

The minimum shear strength parameters, assuming residual strength is mobilized for the final cover system and cohesion/adhesion is equal to zero, are shown in **Table 4**. Additional minimum values where cohesion/adhesion are non-zero are included in **Attachment B.**

Table 4. Minimum Calculated Friction Angles

CONDITION	RESIDUAL INTERFACE FRICTION, ϕ (DEGREES)*	FACTOR OF SAFETY
Final Cover - Static	20.1	1.10

*Calculations of friction angles assume interface adhesion (c) is equal to zero.

Preconstruction testing with actual materials is anticipated to be conducted to verify that the materials used exhibit interface properties above the minimum shear strength envelope.

c. Additional Studies

Following receipt of NOD 3 and subsequent discussions with members of the Department of Environmental Protection's Energy and Environment Cabinet, AECOM conducted additional studies in support of the previously submitted veneer stability analysis. Additional information utilized included landfill peak crest acceleration and laboratory interface direct shear testing results, provided to Big Rivers by WatershedGeo in a letter report dated January 26, 2021, to evaluate performance of the final cover system.

The provided laboratory results indicated interface direct shear testing was performed on representative samples of existing landfill cover soils and proposed Super Gripnet geomembrane. The cover soil was nominally tamped in place, to conservatively represent the materials to be in loose condition in the field, for the tests.

Using the full peak crest acceleration of 0.27g and assuming adhesion is zero (0), the required interface friction angle, between the ClosureTurf Super Gripnet and loose cover soils, was calculated as 33.1 degrees, corresponding to the target factor of safety of 1.0.

Based on the laboratory test results, the peak interface friction angle and adhesion were 33.6 degrees and 4 psf, respectively. These values were plugged into the veneer stability formulations to determine the resulting factors of safety, and results are summarized in **Table 5**.

Table 5. Final Cover Factors of Safety Using Peak Laboratory Results

CONDITION	TARGET FACTOR OF SAFETY	RESULTS
Static (Gravitational Forces Only)	1.50	5.19
Static (Additional Seepage Forces)	1.10	2.00
Static (Equipment Loads)	1.25	1.99
Seismic (Using ½ of Crest PGA =0.135g)	1.00	3.52
Seismic (Using Full Crest PGA =0.27g)	1.00	2.66

Laboratory test results indicated a residual interface friction angle of 31.3 degrees. Results of the residual strength are summarized in **Table 6**.

Table 6. Final Cover Factor of Safety Using Residual Laboratory Results

CONDITION	TARGET FACTOR OF SAFETY	RESULTS
Final Cover - Static	1.10	1.83

In addition, a deformation analysis utilizing the full crest acceleration (0.27 g) and Simplified Seismic Slope Displacement Procedures (Bray, 2007) was performed to evaluate the performance of the ClosureTurf final cover under shallow sliding conditions. Based on the analysis, about 0.3 cm or 0.12-in was the estimated displacement of the final cover system assuming 0.27 g as the spectral acceleration for design earthquake, indicating minimal anticipated displacement. A summary of the calculation is presented as **Attachment D**.

VII. Conclusions

A representative cross-section of the existing landfill slopes, representing the most conservative slope configuration within the proposed special waste landfill footprint, was analyzed for veneer stability to determine the minimum required shear strength parameters for the cap system. The minimum interface shear strength requirements are within a reasonable range for the type of materials specified in the design. **The results of the preconstruction interface testing indicated that even in loose condition, the existing cover soils will provide adequate interface strength in conjunction with the proposed Super Gripnet. In addition, minimal seismic induced displacement is anticipated at full crest acceleration within the ClosureTurf final cover system**. It is the responsibility of the project's design and construction certifying engineer to verify that the materials meet the minimum requirements specified for interface strength as part of this analysis. This testing and verification are outside the current scope of work.

Objective:

Determine the veneer stability of the cover system at the DB Wilson Phase I Landfill.

Method:

Use methods outlined in the paper by Koerner and Soong, Analysis and *Design of Veneer Cover Soils* published in Geosynthetics International, 2005, 12, No.1.

Procedure:

Determine the static stability of the veneer cover system to evaluate the minimum factor of safety for the cover system. Balance the forces as shown in Figure 1 and compare to the required factor of safety (FS).

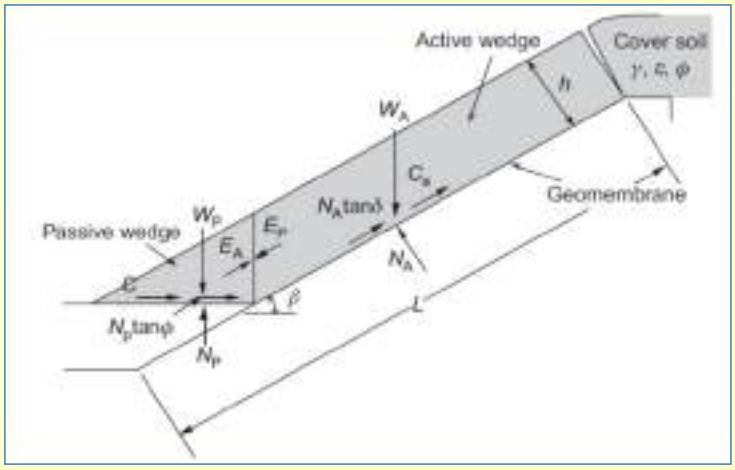

Figure 1. Limit equilibrium forces involved in a finite length slope analysis for a uniformly thick cover soil

Determine: Static factor of safety for cover system based on gravitational forces only and peak strength.

Assumptions:

1. No geosynthetic reinforcements
2. No interface adhesion for geosynthetic components.
3. No tension allowed in geosynthetics
4. Minimum cohesion for multilayered systems

Active Wedge Calculations

Determine the total weight of the active wedge (W_A),the effective force normal to the failure plan of the active wedge (N_A), the adhesive force between the cover soil of the active wedge and the geomembrane (C_a), and the interwedge force acting on the active wedge from the passive wedge (E_A) using the following eqs:

$$W_A = \gamma h^2\left(\frac{L}{h} - \frac{1}{\sin\beta} - \frac{\tan\beta}{2}\right) = 375 \text{ lbs} \qquad N_A = W_A\cos\beta = 356 \text{ lbs}$$

$$C_a = c_a\left(L - \frac{h}{\sin\beta}\right) = - \text{ lbs} \qquad E_A = \frac{(FS)(W_A - N_A\cos\beta) - (N_A\tan\delta + C_a)\sin\beta}{\sin\beta(FS)} = 0 \text{ lbs}$$

Passive Wedge Calculations

Determine the total weight of the passive wedge (W_P),the effective force normal to the failure plan of the passive wedge (N_P), the cohesive force along the failure plane (C), and the interwedge force acting on the passive wedge from the active wedge (E_P) using the following eqs:

$$W_P = \frac{\gamma h^2}{\sin 2\beta} = 0 \text{ lbs} \qquad C = \frac{ch}{\sin\beta} = - \text{ lbs}$$

$$E_P = \frac{C + W_P\tan\phi}{\cos\beta(FS) - \sin\beta\tan\phi} = 0 \text{ lbs} \qquad N_P = W_P + E_P\sin\beta = 0 \text{ lbs}$$

Static Factor of Safety

Determine the calculated Factor of Safety (FS_A) using a quadratic equation relationship where the constants are defined as follows:

$$a = (W_A - N_A\cos\beta)\cos\beta = 36 \text{ lbs/ft}$$

$$b = -\left[\begin{array}{l}(W_A - N_A\cos\beta)\sin\beta\tan\phi \\ +(N_A\tan\delta + C_a)\sin\beta\cos\beta \\ +\sin\beta(C + W_P\tan\phi)\end{array}\right] = (60) \text{ lbs/ft}$$

$$c = (N_A\tan\delta + C_a)\sin^2\beta\tan\phi = 9 \text{ lbs/ft}$$

Results Have Converged

Determine: Static factor of safety for cover system based on additional seepage forces.

Procedure:

Determine the static stability of the veneer cover system to determine the minimum required interface friction angle for all engineered components of the cover system. Balance the forces as shown in Figure 1 and the required factor of safety (FS) then solve for minimum interface shear strength parameters. Account for seepage forces in drainage layer as noted in Figure 2.

Assumptions:

In addition to the static case assumptions:
1. Seepage is parallel to slope

2. Based on results of H&H model, total flow on the slope is less than the internal drainage capacity of Super Gripnet.

3. Hence, no hydraulic head in sand infill.

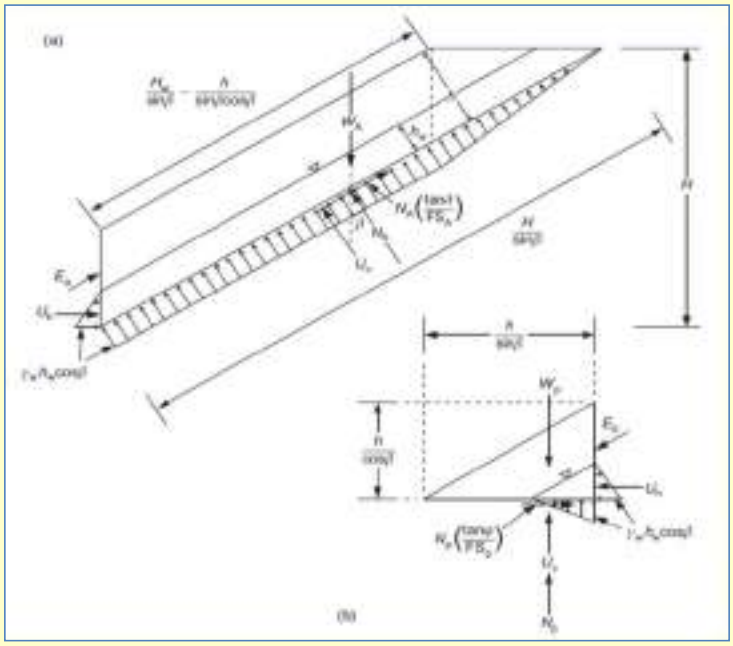

Figure 2. Limit equilibrium forces involved in finite-length slope of uniform cover soil with parallel-to-slope seepage build-up: (a) active wedge; (b) passive wedge

Active Wedge Calculations

Determine the total weight of the active wedge (W_A), resultant of the pore pressures acting on the interwedge surfaces (U_h), resultant of the pore pressures acting perpendicular to the slope (U_n), the effective force normal to the failure plan of the active wedge (N_A), and the interwedge force acting on the active wedge from the passive wedge (E_A) using the following eqs:

$$W_A = \frac{\gamma_D(h-h_W)[2H\cos\beta-(h+h_W)]}{\sin 2\beta} + \frac{\gamma_{SAT}(h_W)(2H\cos\beta-h_W)}{\sin 2\beta} \quad = \quad 376 \text{ lbs}$$

$$U_h = \frac{\gamma_w h_W^2}{2} \quad = \quad 0.00 \text{ lbs} \qquad U_n = \frac{\gamma_w(h_w)(\cos\beta)(2H\cos\beta-h_w)}{\sin 2\beta} \quad = \quad - \text{ lbs}$$

$$N_A = W_A\cos\beta + U_h\sin\beta - U_n \quad = \quad 356 \text{ lbs}$$

$$E_A = W_A\sin\beta - U_h\cos\beta - \frac{N_A\sin\delta}{(FS)} \quad = \quad (26) \text{ lbs}$$

Passive Wedge Calculations

Determine the total weight of the passive wedge (W_P), resultant of the vertical pore pressures acting on the passive wedge (U_V), and the interwedge force acting on the pass wedge from the active wedge (E_P) using the following eqs:

$$W_P = \frac{\gamma_D(h^2-h_w^2)+\gamma_{SAT}h_w^2}{\sin 2\beta} \quad = \quad 0.3 \text{ lbs} \qquad U_V = U_h\cot\beta \quad = \quad 0.0 \text{ lbs}$$

$$E_P = \frac{U_h(FS)-(W_P-U_V\tan\phi)}{\sin\beta\tan\phi-\cos\beta(FS)} \quad = \quad 0 \text{ lbs}$$

Static Factor of Safety w/ Seepage Forces

Determine the calculated Factor of Safety (FS_A) using a quadratic equation relationship where the constants are defined as follows:

$$a = W_A\sin\beta\cos\beta - U_h\cos^2\beta + U_h \quad = \quad 113 \text{ lbs/ft}$$

$$b = -W_A\sin^2\beta\tan\phi + U_h\sin\beta\cos\beta\tan\phi - N_A\cos\beta\tan\delta - (W_P-U_V)\tan\phi \quad = \quad (188.7) \text{ lbs/ft}$$

$$c = N_A\sin\beta\tan\delta\tan\phi \quad = \quad 30 \text{ lbs/ft}$$

Determine: Static factor of safety for cover system based on additional equipment loads.

Procedure:

Determine the static stability of the veneer cover system to determine the minimum required interface friction angle for all engineered components of the cover system. Balance the forces as shown in Figure 1 and the required factor of safety (FS) then solve for minimum interface shear strength parameters. Account for equipment loads (W_b) as final cover is placed as noted in Figure 3.

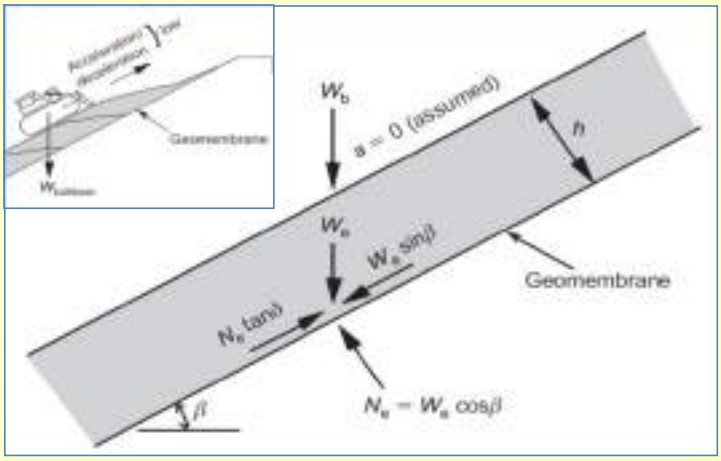

Figure 3. Additional load due to construction equipment moving on cover soil.

Assumptions:

In addition to the static case assumptions:
1. The equipment pushes material up slope leaving a toe buttress behind.
2. The equipment accelerates slowly with no sudden starts or turns to minimize additional loads besides the weight of the machine.

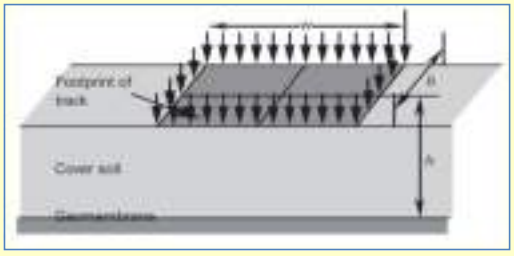

Figure 4. Illustration of stress distribution from overlying equipment.

ATTACHMENT B

Graphical Strength Envelope

MINIMUM REQUIRED SHEAR STRENGTH FOR FINAL COVER VENEER STABILITY

The following chart depicts the minimum required shear strength values along the interfaces of the engineered components of the final cover system under relatively light uniform loads up to the reference load as illustrated in Figure B.3. The envelope depicts the peak shear strength used in the veneer stability analyses represented in the form of the minimum friction angle (ϕ) required to maintain the required factors of safety in the veneer stability analysis. All engineered components of the final cover system located adjacent to an interface along the slope should have a combination of shear strength parameters (i.e. cohesion/adhesion and friction angle, ϕ) where the mininmum strength for a given normal stress exceeds that of the peak shear strength envelope depicted in Figure B.3. Because the normal stress in the veneer analysis is due to a uniform load from the overlying material, a reference stress representing the commensurate normal stress applied from those materials is included on the chart for use in determining appropriate confining pressure for laboratory testing.

Using this reference stress, the acceptable combination of cohesion/adhesion and friction angle are plotted on Figure B.4. Any combination plotting above and to the right of the peak value curve represents acceptable values for this application as long as the field loads are equal to or less than the reference stress.

Sand Infill Hydraulic Stability Calculations

Sand Infill Hydraulic Stability Calculations
Big Rivers Generating Station

Sand infill hydraulic stability in ClosureTurf® has been independently tested by the third-party laboratory, TRI Environmental. A summary of testing and results is provided as Attachment 1. The current ClosureTurf sand infill specification is provided as Attachment 2. Test results demonstrate minimal sand infill mobilization at hydraulic shear values exceeding 1.5 lb/ft^2. The suggested design value for evaluating the potential for infill mobilization is 0.8 lb/ft^2.

Calculations utilizing site specific parameters to estimate hydraulic shear from rainfall runoff are provided. The purpose of the calculations is to evaluate whether the calculated maximum hydraulic shear stress in the sand infill of ClosureTurf exceeds the critical hydraulic shear stress. Three drainage scenarios are evaluated in the following calculations based on the information provided to Watershed Geo by the design engineer. The calculation results are summarized in Table 1 below.

Table 1. Summary of calculation results

Analysis Scenario	Calculated Max. Hydraulic Shear Stress using Super Gripnet® on Top Deck (psf)	Calculated Max. Hydraulic Shear Stress using Super Gripnet® on Side Slope (psf)	Suggested Critical Hydraulic Shear Stress (psf)	Hydraulic Shear Stress (Pass or Fail)
Scenario 1: 55 ft of top deck at 5% slope and 68 ft of side slope at 3.25H:1V	0.0 (Total flow on the top deck is less than the internal drainage capacity of Super Gripnet)	0.0 (Total flow on the slope is less than the internal drainage capacity of Super Gripnet)	0.8	Pass
Scenario 2: 156 ft of side slope at 3.4H:1V	-	0.0 (Total flow on the slope is less than the internal drainage capacity of Super Gripnet)		Pass
Scenario 3: 365 ft of side slope at 6H:1V	-	0.26		Pass

Scenario 1 – 55 ft of Top Deck into 68 ft of Side Slope

The maximum drainage path under Scenario 1 consists of a top deck with an assumed 5% slope with a drainage length of approximately 55 ft that then continues onto a 3.25H:1V side slope with a drainage length of approximately 68 ft.

Design Parameters:

Top Deck:

- Drainage length: L_1 = 55 ft (see Figure 1)
- Slope: S_1 = 5%
- Slope angle: $\alpha_1 = \tan^{-1}(5/100) = 2.86°$
- Hydraulic gradient: i_1 = 5% or 0.05
- Manning's roughness coefficient: n_1 = 0.22 (for slope $\leq$ 10%; See Watershed Geo's ClosureTurf Design Manual)
- Geomembrane type: Super Gripnet (with internal drainage layer)
- Transmissivity of ClosureTurf with Super Gripnet (use the data in Figure 3, the ClosureTurf transmissivity test report by SGI to calculate the transmissivity at the slope of 5% or i = 0.05):
  - Flow Rate: $q = 12.28 \times i^{0.624} = 12.28 \times 0.05^{0.624} = 1.89\ gpm/ft$
  - Transmissivity: $\theta_{i=0.05} = 0.00020697 \times \frac{q}{i} = 0.00020697 \times \frac{1.89}{0.05} = 7.82 \times 10^{-3}\ m^2/sec$

Side Slope:

- Drainage length: L_2 = 68 ft (see Figure 1)
- Slope: S_2 = 30.8% (3.25H:1V)
- Slope angle: $\alpha_2 = \tan^{-1}(1/3.25) = 17.1°$
- Hydraulic gradient: i_2 = 30.8% or 0.308
- Manning's roughness coefficient: n_2 = 0.12 (for slope > 10%; See Watershed Geo's ClosureTurf Design Manual)
- Geomembrane type: Super Gripnet (with internal drainage layer)
- Transmissivity of ClosureTurf with Super Gripnet (use the data in Figure 3, the ClosureTurf transmissivity test report by SGI to calculate the transmissivity at the slope of 3.25H:1V or i = 0.308):
  - Flow Rate: $q = 12.28 \times i^{0.624} = 12.28 \times 0.308^{0.624} = 5.89\ gpm/ft$
  - Transmissivity: $\theta_{i=0.308} = 0.00020697 \times \frac{q}{i} = 0.00020697 \times \frac{5.89}{0.308} = 3.96 \times 10^{-3}\ m^2/sec$

Other Design Parameters:

- Design rain fall intensity (see Figure 2, the 25-yr, 1-hr in NOAA precipitation data):

$$R = 2.35\frac{in}{hr} = 0.196\frac{ft}{hr}$$

- Critical hydraulic shear stress of ClosureTurf with manufactured sand infill:

τ_C = 0.8 psf (see Attachment 1)

Step 1: Calculate the maximum hydraulic shear stress of flow on the top deck

Flow rate on the top deck under the design rainfall intensity (assuming unit width of 1 ft of final cover):

$$q_1 = L_1 \cdot R \cdot \cos\alpha_1 = 55ft \times 0.196\frac{ft}{hr} \times \cos 2.86° = 10.76\frac{ft^2}{hr} = 0.0029\frac{ft^2}{s}$$

Part of the flow is expected to be through the internal drainage channel of the Super Gripnet (i.e., the space within the drainage studs of Super Gripnet). The internal flow capacity of ClosureTurf with Super Gripnet is:

$$q_{int} = \theta_{i=0.05} \cdot i_1 = 7.82 \times 10^{-3}\frac{m^2}{sec} \times 0.05$$
$$= 7.82 \times 10^{-3} \times \frac{(3.28ft)^2}{\left(\frac{1}{3600}\right)hr} \times 0.05 = 15.14\frac{ft^2}{hr}$$

The remaining flow will be through the turf and sand infill:

$$q_1' = q_1 - q_{int} = 10.76\frac{ft^2}{hr} - 15.14\frac{ft^2}{hr} = -4.38\frac{ft^2}{hr} < 0$$

Because the internal drainage capacity of Super Gripnet is greater than the flow rate, no water is expected to flow within the sand infill layer. Therefore, the hydraulic shear stress in the sand infill is zero and no erosion of sand infill is expected to occur.

Step 2: Calculate the maximum hydraulic shear stress of flow on the side slope

Water from the top deck will continue to flow onto the side slope. The total flow at the end of the side slope is:

$$q_{total} = q_1 + q_2 = q_1 + L_2 \cdot R \cdot \cos\alpha_2 = 10.76\frac{ft^2}{hr} + \left(68ft \times 0.196\frac{ft}{hr} \times \cos 17.1°\right)$$
$$= 23.49\frac{ft^2}{hr} = 0.0065\frac{ft^2}{s}$$

Part of the flow is expected to be through the internal drainage channel of the Super Gripnet (i.e., the space within the drainage studs of Super Gripnet). The internal flow capacity of ClosureTurf with Super Gripnet is:

$$q_{int} = \theta_{i=0.308} \cdot i_2 = 3.96 \times 10^{-3}\frac{m^2}{sec} \times 0.308$$

$$= 3.96 \times 10^{-3} \times \frac{(3.28ft)^2}{\left(\frac{1}{3600}\right)hr} \times 0.308 = 47.24 \frac{ft^2}{hr}$$

The remaining flow will be through the turf and sand infill:

$$q'_{total} = q_{total} - q_{int} = 23.49 \frac{ft^2}{hr} - 47.24 \frac{ft^2}{hr} = -23.75 \frac{ft^2}{hr} < 0$$

Because the internal drainage capacity of Super Gripnet is greater than the flow rate, no water is expected to flow within the sand infill layer. Therefore, the hydraulic shear stress in the sand infill is zero and minimal sand infill mobilization is expected to occur.

Scenario 2 – 156 ft of Side Slope at 3.4H:1V

The maximum drainage path under Scenario 2 consists of a side slope with a 3.4H:1V slope and a drainage length of approximately 156 ft that does not receive flow from a top deck.

Design Parameters:

Side Slope:

- Drainage length: L_1 = 156 ft (See Figure 1)
- Slope: S_1 = 29.4% (3.4H:1V)
- Slope angle: $\alpha_1 = \tan^{-1}(1/3.4) = 16.4°$
- Hydraulic gradient: i_1 = 29.4% or 0.294
- Manning's roughness coefficient: n_1 = 0.12 (for slope > 10%; See Watershed Geo's ClosureTurf Design Manual)
- Geomembrane type: Super Gripnet (with internal drainage layer)
- Transmissivity of ClosureTurf with Super Gripnet (use the data in Figure 3, the ClosureTurf transmissivity test report by SGI to calculate the transmissivity at the slope of 29.4% or i = 0.294):
  - Flow Rate: $q = 12.28 \times i^{0.624} = 12.28 \times 0.294^{0.624} = 5.72\ gpm/ft$
  - Transmissivity: $\theta_{i=0.294} = 0.00020697 \times \frac{q}{i} = 0.00020697 \times \frac{5.72}{0.294} = 4.03 \times 10^{-3}\ m^2/sec$

Other Design Parameters:

- Design rain fall intensity (see Figure 2, the 25-yr, 1-hr in NOAA precipitation data):

$$R = 2.35\frac{in}{hr} = 0.196\frac{ft}{hr}$$

  Critical hydraulic shear stress of ClosureTurf with manufactured sand infill: $\tau_C = 0.8\ psf$ (see Attachment 1)

Step 1: Calculate the maximum hydraulic shear stress of flow on the slope

Flow rate on the slope under the design rainfall intensity (assuming unit width of 1 ft of final cover):

$$q_1 = L_1 \cdot R \cdot \cos\alpha_1 = 156ft \times 0.196\frac{ft}{hr} \times \cos 16.4° = 29.33\frac{ft^2}{hr} = 0.0081\frac{ft^2}{s}$$

Part of the flow is expected to be through the internal drainage channel of the Super Gripnet (i.e., the space within the drainage studs of Super Gripnet). The internal flow capacity of ClosureTurf with Super Gripnet is:

$$q_{int} = \theta_{i=0.294} \cdot i_1 = 4.03 \times 10^{-3}\frac{m^2}{sec} \times 0.294$$

$$= 4.03 \times 10^{-3} \times \frac{(3.28ft)^2}{\left(\frac{1}{3600}\right)hr} \times 0.294 = 45.89 \frac{ft^2}{hr}$$

The remaining flow will be through the turf and sand infill:

$$q_1' = q_1 - q_{int} = 29.33 \frac{ft^2}{hr} - 45.89 \frac{ft^2}{hr} = -16.56 \frac{ft^2}{hr} < 0$$

Because the internal drainage capacity of Super Gripnet is greater than the flow rate, no water is expected to flow within the sand infill layer. Therefore, the hydraulic shear stress in the sand infill is zero and minimal sand infill mobilization is expected to occur.

Scenario 3 – 365 ft of Side Slope at 6H:1V

The maximum drainage path under Scenario 3 consists of a side slope with a 6H:1V slope and a drainage length of approximately 365 ft that does not receive flow from a top deck.

Design Parameters:

Side Slope:

- Drainage length: L_1 = 365 ft (See Figure 1)
- Slope: S_1 = 16.7% (6H:1V)
- Slope angle: $\alpha_1 = \tan^{-1}(1/6) = 9.46°$
- Hydraulic gradient: i_1 = 16.7% or 0.167
- Manning's roughness coefficient: n_1 = 0.12 (for slope > 10%; See Watershed Geo's ClosureTurf Design Manual)
- Geomembrane type: Super Gripnet (with internal drainage layer)
- Transmissivity of ClosureTurf with Super Gripnet (use the data in Figure 3, the ClosureTurf transmissivity test report by SGI to calculate the transmissivity at the slope of 16.7% or i = 0.167):
  - Flow Rate: $q = 12.28 \times i^{0.624} = 12.28 \times 0.167^{0.624} = 4.02\ gpm/ft$
  - Transmissivity: $\theta_{i=0.167} = 0.00020697 \times \frac{q}{i} = 0.00020697 \times \frac{4.02}{0.167} = 4.98 \times 10^{-3}\ m^2/sec$

Other Design Parameters:

- Design rain fall intensity (see Figure 2, the 25-yr, 1-hr in NOAA precipitation data):

$$R = 2.35\frac{in}{hr} = 0.196\frac{ft}{hr}$$

- Critical hydraulic shear stress of ClosureTurf with manufactured sand infill: $\tau_C = 0.8\ psf$ (see Attachment 1)

Step 1: Calculate the maximum hydraulic shear stress of flow on the slope

Flow rate on the slope under the design rainfall intensity (assuming unit width of 1 ft of final cover):

$$q_1 = L_1 \cdot R \cdot \cos\alpha_1 = 365ft \times 0.196\frac{ft}{hr} \times \cos 9.46° = 70.56\frac{ft^2}{hr} = 0.0196\frac{ft^2}{s}$$

Part of the flow is expected to be through the internal drainage channel of the Super Gripnet (i.e., the space within the drainage studs of Super Gripnet). The internal flow capacity of ClosureTurf with Super Gripnet is:

$$q_{int} = \theta_{i=0.167} \cdot i_1 = 4.98 \times 10^{-3}\frac{m^2}{sec} \times 0.167$$

$$= 4.98 \times 10^{-3} \times \frac{(3.28ft)^2}{\left(\frac{1}{3600}\right)hr} \times 0.167 = 32.21\frac{ft^2}{hr}$$

The remaining flow will be through the turf and sand infill:

$$q_1' = q_1 - q_{int} = 70.56\frac{ft^2}{hr} - 32.21\frac{ft^2}{hr} = 38.35\frac{ft^2}{hr} = 0.0106\frac{ft^2}{s}$$

The flow rate:

$$q_1' = v_1 \cdot A_1 = v_1 \cdot (H_1 \times 1\,ft) = v_1 \cdot H_1$$

Where, H_1 is flow depth on the slope (ft). Using the Manning's Equation and assuming the hydraulic radius equals to the flow depth (in ft):

$$v_1 = \frac{1.49}{n_1} H_1^{\frac{2}{3}} \sqrt{S_1}$$

Therefore,

$$q_1' = v_1 \cdot H_1 = \frac{1.49}{n_1} H_1^{\frac{2}{3}} \sqrt{S_1} \cdot H_1 = \frac{1.49}{n} H_1^{\frac{5}{3}} \sqrt{S_1}$$

Solve the above equation for H_1,

$$H_1 = \left(\frac{q_1' \cdot n_1}{1.49 \cdot \sqrt{S_1}}\right)^{\frac{3}{5}} = \left(\frac{0.0106 \times 0.12}{1.49 \cdot \sqrt{0.167}}\right)^{\frac{3}{5}} = 0.025ft$$

The maximum hydraulic shear stress by the water flow on slope:

$$\tau_1 = \gamma_w \cdot H_1 \cdot S_1 = 62.4\frac{lb}{ft^3} \times 0.025\,ft \times 0.167 = 0.26\,psf < \tau_c = 0.8\,psf, \textbf{PASS}!$$

The calculated maximum hydraulic shear stress in the sand infill is less than the critical hydraulic shear stress, indicating minimal sand infill mobilization is expected to occur.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

ClosureTurf® Sand Infill Specification

This ClosureTurf® Specification document has been prepared to provide the Owner, Design Engineer, Construction Quality Assurance Professional of Record, and the Contractor / Installer with a general guidance specification. All information, recommendations and suggestions appearing in this specification concerning the use of our products are based upon experience, tests and data believed to be reliable; however, this information should not be used or relied upon for any specific application without independent professional examination and verification of its accuracy, suitability and applicability. The independent professional shall edit this document to suit the site-specific project design criteria. Since the actual use by others is beyond our control, no guarantee or warranty of any kind, expressed or implied, is made by Watershed Geosynthetics LLC as to the effects of such use or the results to be obtained, nor does Watershed Geosynthetics LLC assume any liability in connection herewith. Any statement made herein may not be absolutely complete since additional information may be necessary or desirable when particular or exceptional conditions or circumstances exist or because of applicable laws or government regulations. ClosureTurf® is a U.S. registered trademark which designates a product from Watershed Geosynthetics LLC. This product is the subject of issued U.S. and foreign patents and/or pending U.S. and foreign patent applications. Nothing herein is to be construed as permission to grant license or as a recommendation to infringe any patent.

PART 2: PRODUCTS

2.01 DESCRIPTION

Sand Infill Component of the ClosureTurf® System shall meet the fine aggregate angularity, specific gravity and grain size distribution as specified by WatershedGeo in this Specification.

A. Fine aggregate angularity shall be tested in accordance with ASTM C 1252 / AASHTO T 304, *Standard Test Methods for Uncompacted Void Content of Fine Aggregate (as Influenced by Particle Shape, Surface Texture, and Grading). Method A.* Method A uncompacted void content shall be greater than or equal to 40%.

B. Sand infill specific gravity shall be tested in accordance with ASTM C 128 / AASHTO T 84, *Standard Test Method for Relative Density (Specific Gravity) and Absorption of Fine Aggregate.* Bulk oven-dry specific gravity shall be greater than or equal to 2.40.

C. Sand infill grain size distribution shall be tested in accordance with ASTM C 136 / AASHTO T 27, *Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates.* The grain size distribution shall be as prescribed in Table 1 and presented in Figure 1.

Table 1. Sand Infill Grain Size Distribution

		3/8" (9.5 mm)	≤	100%
90%	≤	#4 (4.75 mm)	≤	100%
50%	≤	#8 (2.36 mm)	≤	85%
25%	≤	#16 (1.18 mm)	≤	65%
10%	≤	#30 (0.60 mm)	≤	45%
0	≤	#50 (0.30 mm)	≤	30%
0	≤	#100 (0.15 mm)	≤	10%
0	≤	#200 (0.075 mm)	≤	5%

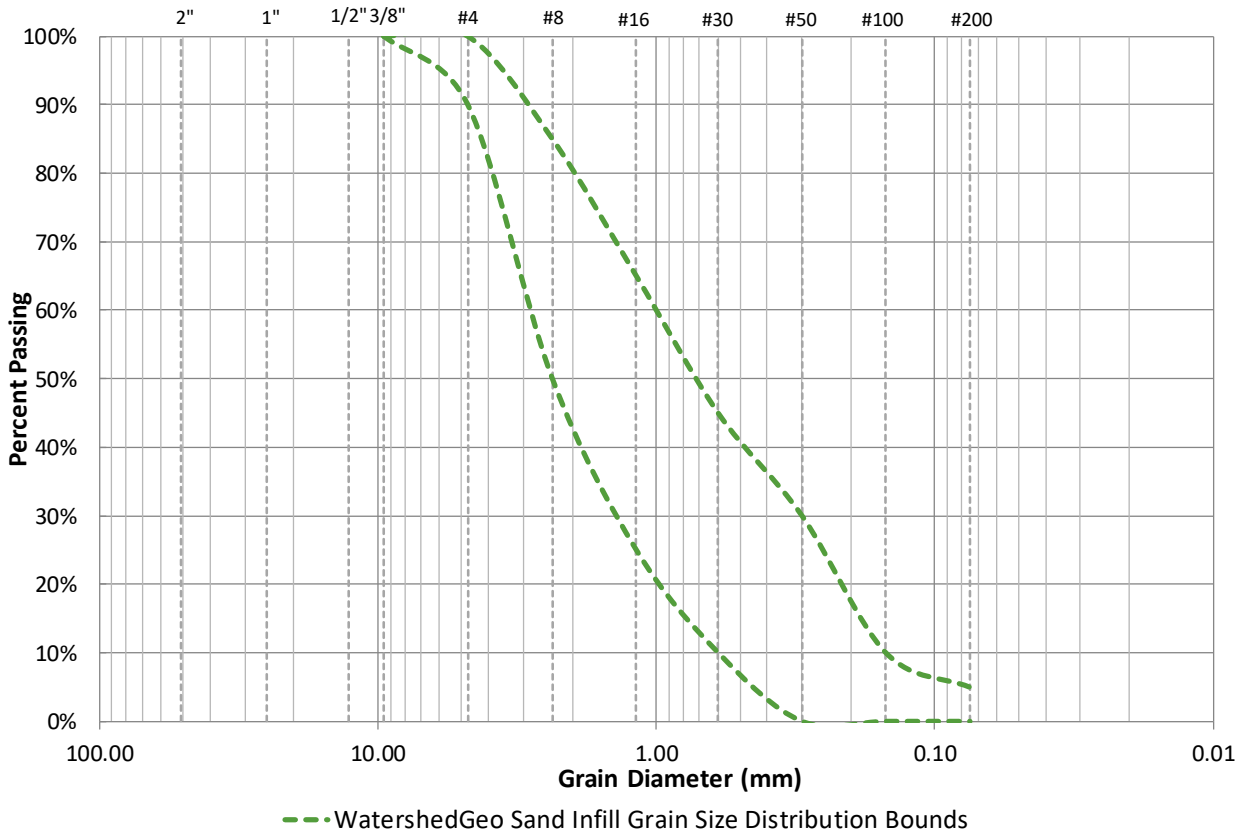

Figure 1: ClosureTurf® Specified Infill Grain Size Distribution

D. Documentation of sand infill conformance with ASTM C 136 / AASHTO T 27, ASTM C 128 / AASHTO T 84 and ASTM C 1252 / AASHTO T 304 shall be submitted to the specified CQA personnel.

E. Subsequent to initial verification of specification conformance, sand infill shall have grain size distribution conformance verified and documented for each 175 cubic yards to be installed.

PART 3: EXECUTION:

Not Used. See Section 01 73 19 ClosureTurf® Installation Specifications.

M	7.7		New Madrid Seismic Zone

Probability of "Zero" Displacement

$$P(D = 0) = 1 - \Phi(-1.76 - 3.22\ln(k_y) - 0.484(T_s)\ln(k_y) + 3.52\ln(S_a(1.5T_s)))$$

P(D="0") = 0.9883888 98.84% Chance of "zero" displacement

Predicted Displacement

$$\ln(D) = -1.10 - 2.83\ln(k_y) - 0.333\left(\ln(k_y)\right)^2 + 0.566\ln(k_y)\ln(S_a(1.5T_s))$$

ln(D) = -1.29746
D = 0.2732249

median = 0.3 cm
anticipated range = 0.1 to 0.5 cm

Appendix A – DEEPSOIL Files

1. Introduction

A site-specific deterministic seismic hazard analysis (DSHA) was performed for the DB Wilson Generating Station Special Waste Landfill Facility to develop site-specific ground motions. The DSHA was performed for bedrock material to provide seismic ground motions as input to site response and engineering analysis of the facility. A site response analysis was performed to modify the bedrock ground motions and develop site-specific response spectra for both the toe and crest of the Phase I CCR (Coal Combustion Residuals) landfill facility. The landfill consists of approximately 166 feet of waste material (POZ-O-TEC). The landfill is founded on mine spoils overlying shale bedrock. The facility is located in Ohio County, Kentucky, approximately 900 m north of Kentucky Route 85 and east of the Green River near Centertown, Kentucky (Figure 1).

2. Seismotectonic Setting and Historical Seismicity

The current tectonic setting of eastern North America on a passive margin, several thousand kilometers from any active plate boundary, makes it difficult to explain the seismicity in the region in terms of a simple plate-tectonic model (Ebel and Kafka, 1991). In fact, the last major tectonic activity in the eastern U.S. took place during the Mesozoic.

The occurrence of seismicity in the absence of significant tectonic activity in this region is complicated by the inability to characterize individual structures that may have been active in recent times, e.g., late Quaternary. The regional seismicity generally does not delineate any clear active structural boundaries to serve as a guide in mapping active faults that may be correlated with seismic activity (with a few notable exceptions) (Ebel and Kafka, 1991).

The most widely accepted interpretation of the cause of seismicity in the eastern North America is that earthquakes result from the reactivation of ancient structures in the present-day stress field (Ebel and Kafka, 1991). The central and eastern U.S. (CEUS) is part of a broad mid-plate compressive stress province that includes most of Canada (Zoback and Zoback, 1991). Based on a compilation of focal mechanism data, Ebel and Kafka (1991) report that the current stress field over this large region is in a relatively uniform east-northeast direction of maximum horizontal compression. This direction of maximum horizontal compression corresponds well to the direction of absolute plate motion of the North American Plate. This suggests that a far-field tectonic source such as ridge-push or basal drag at the Mid-Atlantic Ridge may be the primary source of stress in the mid-plate region (Zoback and Zoback, 1991). Most of the ancient structures and zones of weakness in the eastern U.S. trend approximately north-northeast, largely resulting from east-west directed continental collision and rifting events.

The stress regime, along with the structural features developed through the geologic history described above controls the occurrence and localization of seismicity in the region. It is generally agreed, as manifested in recent regional source characterizations for seismic hazard assessments in the eastern U.S. that, in contrast to the plate boundary faults that control seismic hazard in the western U.S., seismicity and consequent hazard in the east is largely controlled by pre-existing zones of weakness that are favorably oriented in the modern stress field (EPRI/DOE/NRC, 2012, and included references). This includes regions of Mesozoic extension but also those of older extensional episodes such as the Iapetan Rift Margin (IRM).

2.1 Historical Seismicity

The facility is located in the Midcontinent region of the U.S. away from active plate boundaries in a region that exhibits a low level of historical seismicity (Figure 1). There have been no known events of moment magnitude (**M**) 5.0 or greater within 100 km of the facility, while 10 events of **M** 5.0 or greater have occurred within 250 km of the facility, most associated with the New Madrid Seismic zone or the Wabash Valley seismic zone (Figure 1).

New Madrid Seismic Zone

The most significant earthquakes to have occurred in the CEUS are the 1811-1812 **M** 7 to 8 New Madrid earthquake sequence (Figure 1). The New Madrid earthquake sequence occurred over the winter of 1811-1812 in southeastern Missouri/northeastern Arkansas. This sequence, which was felt as far away as the East Coast, consisted of three principal events on 16 December 1811, 23 January 1812, and 7 February 1812. Because the epicentral region was sparsely populated at the time of the events, little structural damage occurred, and the maximum Modified Mercalli intensity (MMI) is IX as reinterpreted by Hough et al. (2000). The facility probably underwent strong ground shaking of MMI VII to VIII in the 16 December 1811 mainshock (Hough et al., 2000). The New Madrid Seismic Zone is currently the most seismically active area in the CEUS (Figure 1).

The faults of the New Madrid fault system are defined primarily based on concentrations of seismicity as geomorphic expression of faulting is poor; only the Reelfoot reverse fault is well expressed as a definitively tectonic feature. Several different geologic faults have been postulated as the source of the events but there remains considerable uncertainty in defining the causative faults. The southern and northern sections of the fault system are northeast-striking features that are probably ancient faults related to rifting that have been reactivated in the modern stress regime as primarily right-lateral strike-slip faults. Focal mechanisms from these areas are consistent with predominantly dextral motion. The Reelfoot reverse fault strikes northwest and dips southwest; earthquakes associated with it have a variety of focal mechanisms. The fault has been described as a cross-structure in a compressional left step between right-lateral strike-slip faults.

Wabash Valley Seismic Zone

The Wabash Valley seismic zone is a region of southwestern Indiana and southeastern Illinois that contains the Wabash Valley fault system (WVFS). Numerous Holocene paleoliquefaction features have been mapped along river valleys within the Wabash Valley Seismic Zone and other regions of southern Indiana and Illinois and have been interpreted as having been caused by paleoearthquakes (e.g., Obermeier et al., 1993). However, the faults of the WVFS have been mapped as pre-Quaternary, and no fault has been identified as the causative structure for the liquefaction nor been explicitly correlated with historic or paleoseismicity.

The Wabash Valley has historically been seismically active with several earthquakes of **M** 4.5 and larger (Figure 1). An event on 27 September 1891 occurred near Mt. Vernon, Illinois, which caused chimney damage in the epicentral area (Stover and Coffman, 1993). The size of the earthquake was estimated to be a **M** 4.9 and the event was felt widely in several states. On 31 October 1895, an earthquake of estimated **M** 6.0 struck the northern end of the New Madrid Seismic Zone (Figure 1). This is the largest earthquake to have occurred in the central Mississippi Valley since 1811-1812 (Stover and Coffman, 1993). The event caused extensive damage in the town of Charleston, Missouri. Sand blows due to liquefaction were also reported in the epicentral area (Stover and Coffman, 1993). On 9 November 1968, a **M** 5.3 earthquake struck southern Illinois and neighboring states with a maximum reported MM VII. Damage consisted of damaged chimneys, broken windows, cracked or fallen plaster, cracked foundations, and scattered instances of collapsed parapets (Stover and Coffman, 1993).

Another notable earthquake was the 18 April 2008 **M** 5.4 Southern Illinois earthquake northwest of the facility (Figure 1).

3. Seismic Hazard Analysis Methodology

The design earthquake ground motions for the facility were developed using a deterministic seismic hazard analysis. The approach to develop the design acceleration response spectra consisted of the following steps:

- Identification of the potential seismic sources that could produce ground motions of engineering significance at the site and estimation of the maximum considered earthquake that could reasonably be expected from these sources.
- Characterization of the seismic sources, including fault-to-site distances.
- Select appropriate ground motion models to estimate ground motions as a function of earthquake magnitude, distance, and site condition;
- Development of the range of ground motions (median, 84th percentile) that are likely to occur at the site due to the maximum considered earthquake for each seismic source.
- Enveloping the ground motions from each seismic source to develop the controlling maximum earthquake with the potential for generating the strongest ground motions at the site.

3.1 Site Geologic Conditions

A geophysical investigation was performed at the facility using multichannel analysis of surface-waves (MASW). The MASW method involves the profiling of shear wave velocities (V_s) through analysis of the dispersion of surface waves. MASW Line-1000 was centered at geotechnical boring TOE-1 and MASW Line-3000 was positioned along the toe of the landfill approximately 91 m (300 feet) north of TOE-1 (AECOM Geophysical Services Group, 2021). The V_s profile for MASW Line-1000 and Line-3000, both at the toe of the landfill is shown on Figure 3. Based on borehole logs of the TOE-1 borehole, below a depth of 11.7 m (38.5 feet) the geology generally consists of fresh to slightly weathered shale. Above this depth the geology material consists of slit, clayey sand and gravels. The seismic hazard analysis was performed for the shale geologic material. The average time-average shear wave velocity in the upper 30 m (V_{S30}) of the shale for the two profiles is 855 m/sec (2,805 ft/sec) and was used in the hazard analysis.

3.2 Ground Motion Prediction Models

Crustal ground motion prediction models for tectonically active regions like the western U.S. are empirical in nature and derived from strong motion data from such areas as California, Taiwan, Japan, and Italy. In contrast, few useable strong motion records exist for earthquakes in the Central and Eastern North America (CENA). Thus, ground motion models (GMMs) for the CENA have been developed, in large part, using seismological-based numerical models. Recent efforts have been made to update the ground motion models for the CENA. One such project is the Next Generation Attenuation for Central and Eastern North America project (NGA-East), a large multidisciplinary project coordinated by the Pacific Earthquake Engineering Research (PEER) Center.

The NGA-East project (Goulet et al., 2018) objective was to provide the best estimate of the distribution (median and standard deviation) horizontal ground motions for the peak ground acceleration (PGA) and 5%-damped pseudo-acceleration response spectra (PSA) for oscillator periods ranging from 0.01 to 10 sec on “hard-rock sites located up to 1500 km from future

earthquakes in CENA with moment magnitudes in the 4.0–8.2 range, and to provide the epistemic uncertainty associated with this estimate.

The NGA-East project considered 30 median GMMs and selected 19 of the GMMs, or "seed" models, for further investigation. These seed models were used to generate a continuous distribution of GMMs for each ground motion intensity measure. A set of 10,000 GMMs were sampled from the continuous GMMs distribution. The 10,000 "sampled ground motion models" were "grouped" into 17 cells in a process using Sammon's maps. The 17 resulting GMMs are the final NGA-East ground motion models. These 17 GMMs were then assigned weights for logic tree and seismic hazard applications.

The NGA-East ground motion models are for hard rock (V_{S30} ~ 3,000 m/sec), and thus need to be adjusted to be consistent with the local site conditions. The hard rock ground motions were converted to a V_{S30} of 855 m/sec using the Stewart et al. (2017a, 2017b) and Hashash et al. (2017) site factors derived for the CEUS. The site factors are period dependent and utilize the hard rock PGA value. These site factors were recently modified by Abrahamson et al. (2020) to ensure consistency between the site factors and the site terms as developed for the ground motion models.

4. DSHA Results

Three sources, the Wabash Valley Seismic Zone, the New Madrid Seismic Zone and a background (random) earthquake (Figure 1) were identified for the facility. The magnitudes of the sources were based on Wang (2010) and are listed in Table 1, along with the distance from the facility. The distance for the background earthquake is somewhat arbitrary, but reasonable given the level of seismicity in the facility region outside of identified seismic zones (Figure 1). The DSHA calculations were made using the NGA-East ground-motion characterization tool developed by The B. John Garrick Institute for the Risk Sciences, UCLA Engineering, Natural Hazards Risk and Resiliency Research Center (https://www.risksciences.ucla.edu/nhr3/gmtools). The weighted average ergodic sigma model was used in calculating the 84th percentile (median plus one sigma). The median, median plus one sigma and median minus one sigma for a V_{S30} of 3,000 m/sec are provided in Table 2.

Figure 2 shows the 84th percentile 5%-damped acceleration response spectra for the three sources using the NGA-East ground motion models and adjusted to a V_{S30} of 855 m/sec, with the values given in Table 3. The Wabash Valley seismic zone gives the highest spectral accelerations for periods less than 0.1 sec, while the New Madrid seismic zone gives the highest spectral accelerations for periods greater than 0.1 sec.

5. Spectrally Matched Time Histories

Three sets of two-component horizontal time histories were spectrally matched to the target spectrum for use in a site-response analysis. The target spectrum is the envelope of the 84th percentile spectra for a V_{S30} = 855 m/sec as presented in Section 4 (Table 3).

Because the response spectrum of a time history has peaks and valleys that deviate from the design response spectrum (target spectrum), it is necessary to modify the motion to improve its response spectrum compatibility. The procedure proposed by Lilhanand and Tseng (1988), as modified by Al Atik and Abrahamson (2010) and contained in the computer code RSPmatch09, was used to develop the acceleration time histories through spectral matching to the target spectrum. This time-domain procedure has been shown to be superior to previous frequency-domain approaches because the adjustments to the time history are only done at the time at which the spectral response occurs resulting in only localized perturbations on both the time history and the spectra (Lilhanand and Tseng, 1988). This process preserves the non-stationary properties of the original time history and develops a time history with a realistic displacement waveform.

To match the target spectrum, seed time histories should be from events of similar magnitude and distance (for duration), tectonic environment and most importantly, spectral shape as the earthquake dominating the spectrum. As the New Madrid seismic zone spectrum is the controlling spectrum for most the target spectrum (periods greater than 0.1 sec), and for the periods most likely to impact the facility, seed motions were selected based on the New Madrid seismic zone event. Recordings from large magnitude events in stable continental regions are not available, therefore, one ground motion is from crustal earthquakes from active tectonic regions with **M** greater than 7.0, and two time histories are simulated ground motions from the PEER NGA-East project (PEER, 2015). These simulations were developed using the Graves and Pitarka (2015) method and are described further in Appendix 1B of PEER (2015).

Table 4 lists the seed time histories used in the spectral matching and their properties. Figure 4 compares the response spectra for the three two-component horizontal seed time histories scaled to PGA of the target spectrum. The acceleration time histories for these seeds are provided in Figures 5 to 7.

The spectral matches and resulting time histories are shown on Figures 8 to 19. Shown with the time histories is a Husid plot (bottom of figure) which illustrates the increase in energy (normalized Arias intensity) with time. Also, shown with the time histories for comparison are the seed time histories to demonstrate how the time history has changed in the matching process. Table 5 lists the properties of the time histories spectrally matched to the target spectrum.

Time history properties given in Tables 4 and 5 include 5-95% significant durations and Arias Intensity. Arias Intensity is a ground motion parameter defined by Arias (1970) as the integral of the square of acceleration over the duration of a time history record, as follows:

$$I_a = \frac{\pi}{2g}\int_0^{\infty} a(t)^2 dt$$

where I_a is Arias Intensity, a(t) is acceleration, and g is the acceleration of gravity. Studies have shown that I_a correlates well with the damage potential of earthquakes (Travasarou et al., 2003). The target Arias Intensity for the horizontal time histories was computed using the referenced empirical model of Farhadi and Pezeshk. (2020). This model is based on data from the NGA-East ground motion database and is referenced to the Campbell and Bozorgnia (2014) ground motion prediction model. The median and ± one standard deviation are listed in Table 6. The spectrally matched horizontal time histories generally fall within these ranges (Table 6).

Duration of a strong ground motion is related to the time required for release of accumulated strain energy by rupture along the fault and generally increases with magnitude of the earthquake. Trifunac and Brady (1975) defined significant duration as the time interval between the points at which 5% and 95% of the total energy (I_a) has been recorded. The target duration for the time histories was calculated using the empirical model of Kempton and Stewart (2006). This model is based on data from the NGA-West database and is a function of magnitude, distance and V_{S30}. There is no known model for duration for stable continental regions. The median and ± one standard deviation are listed in Table 6. The spectrally matched horizontal time histories generally fall within these ranges (Table 6).

Maximum	0.90	58.4	+1 Standard Deviation	2.42	70.9

6. Site Response Analysis

To estimate ground surface response spectra, site response analysis was performed using the developed time histories, discussed above. This section presents the methodology, dynamic material properties, and results of the site response analysis.

6.1 Methodology

Dynamic site response analyses were performed to estimate the ground surface response spectra under the design earthquake event at the crest and toe of the landfill. The one-dimensional site response analysis was performed using the program DEEPSOIL version 7 (Hashash et al. 2020). Both equivalent-linear and nonlinear site response analyses can be performed with the program DEEPSOIL.

The program performs a nonlinear, time-domain analysis of soil dynamic response, using a pressure dependent hyperbolic model based on the Matasovic/Konder/Zelasko (MKZ) model (Matasovic, 1993). Additions to the MKZ model include a parameter allowing the shape of the backbone curve to be adjusted and a parameter to introduce stress-dependence to the backbone curve. A stress-dependent small-strain damping is used as part of the integration scheme to capture viscous damping observed at small strains. Hysteretic behavior is modeled using a non-Masing approach (Phillips and Hashash, 2009) which allows the model to be fit to laboratory modulus reduction curves and damping curves independently. The program allows nonlinear model parameters to be developed by fitting to modulus reduction and damping curves provided by the user (i.e. the typical inputs to an equivalent-linear site response analysis).

6.2 Dynamic Material Properties

Dynamic material properties were developed based on the results on the borings laboratory testing and geophysical testing performed as part of this project. AECOM performed the multichannel analysis of surface waves (MASW) method to profile shear wave velocity at three locations, two at the toe of the landfill and one at the crest (AECOM Geophysical Services Group, 2021). The idealized shear wave velocity profiles and the MASW results for the crest and toe of the landfill are presented in Figures 20 and 21, respectively. Due to the nature of the

mine spoil materials, a stress-based shear modulus number, K_{2max} (Seed and Idriss 1970), was fitted to the time weighted average of the MASW results for the mine spoils. The POZ-O-TEC is a lime-fly ash mixture with grain sizes from a silty sand to a sandy silt. Due to the silty nature of the POZ-O-TEC, the Seed and Idriss (1970) G/G_{max} and damping curves selected to approximate the modulus degradation and damping. The mine spoils were generated from shale bedrock and are primarily clayey with a Plasticity Index (PI) of around 13. For the mine spoils, G/G_{max} and damping curves developed by Vucetic and Dobry (1991) for clay with a PI of 15 were selected to approximate the modulus degradation and damping of the mine spoils. The profile and selected dynamic material properties are shown in Table 7. The modulus reduction and damping curves are presented in Figure 22.

Table 7. Profiles and Dynamic Material Properties

Material	Unit Weight (pcf)	Shear Wave Velocity/ K_{2max}	G/Gmax & Damping Curve	Crest Profile Thickness (ft)	Toe Profile Thickness (ft)
POZ-O-TEC	90	1275 f/sec	Seed and Idriss, Upper Bound (1970)	166	NA
Mine Spoils	110	K_{2max} = 45 or 60	Vucetic and Dobry, PI =15 (1991)	29	38.5
Bedrock Half space	160	2805 ft/sec	-	-	-

6.3 Analysis Results

The calculated response spectra at the crest, the base of the landfill below the crest, and toe for the design earthquake are presented in Figures 23 through 28. The maximum spectra for both the crest, the base of the landfill below the crest, and toe profiles along with the bedrock spectra from the DSHA is presented in Figure 29. The PGA of the bedrock, the crest, the base of the landfill below the crest, and toe are 0.14 g, 0.27 g, 0.31 g, and 0.34 g, respectively. In general, both profiles amplified the motion with the toe profile amplifying the PGA slightly more than the crest. The crest profile lengthened the spectra more than the toe profile. Output from the DEEPSOIL program is presented in Appendix A.

7. Limitations

This Report was prepared for accordance with the scope of work between AECOM and Big Rivers Electric Corporation. The information, data, recommendations, and conclusions contained in this Report represent AECOM's professional judgement considering these Limitations and industry standards for the preparation of similar reports.

This report was prepared for the specific purposes described in the Report and the scope of work. The referenced subsurface geotechnical conditions are based on limited testing and on the assumption that such conditions are uniform and not variable either geographically or over time.
